On looking through the instrument the square hole appears double, the light which passes through being divided into two rays polarized in planes at right angles to each other; and if a dichroic crystal is placed in front of it, the two images, corresponding to the two sets of light-vibrations, will appear of different colors. A dichroscope may be combined with the polarizing apparatus of a microscope.

[< Gr. *δι-*, two-, + *κοτυληδών*, a cavity: see *cotyledon*.] A plant which produces an embryo having two cotyledons. Dicotyledons form a natural class of the phænogamous series of plants, characterized by the two opposite cotyledons, an exogenous mode of growth, and a netted venation of the leaves, and by seldom having a trimerous arrangement of the parts of the flower. From the structure of the stem, increasing by external growth, they are also known as *exogens*. The gymnosperms, in which the embryo has several cotyledons in a whorl, are usually included as a subclass, but by some recent botanists they are ranked as a distinct class. According to the more usual arrangement, the angiospermous dicotyledons are divided by the characters of the perianth into *Polypetalæ*, *Gamopetalæ*, and *Apetalæ* or *Monochlamydeæ*. These are subdivided into 164 orders. Several modifications of this system have been adopted, especially by continental European botanists, the most important of which is the distribution of the apetalous orders among the two other divisions. The total number of species of dicotyledonous plants now known is about 80,000, included under about 6,000 genera. See *exogen*.

A person possessing unlimited powers of government; an absolute ruler. In ancient Rome dictators were appointed in times of exigency and distress for a term of six months; and there were also dictators with powers limited to specific acts. In later times usurpers have often made themselves dictators, and dictatorial powers have been expressly conferred. The rulers of Paraguay bore the title of dictator for many years, and those of several other Spanish-American countries have done so for longer or shorter periods.

Government must not be a parish clerk, a justice of the peace. It has, of necessity, in any crisis of the state, the absolute powers of a *Dictator.*

2. A person invested with or exercising absolute authority of any kind; one who assumes to control or prescribe the actions of others; one who dictates.

2†. A word.

In *dictions* are first to be considered their etymology and conjugation. *Burgersdicius*, tr. by a Gentleman.

=**Syn.** *Diction*, *Phraseology*, *Style*. *Diction* refers chiefly to the choice of words in any utterance or composition. *Phraseology* refers more to the manner of combining the words into phrases, clauses, and sentences: as, legal *phraseology*; but it also necessarily involves diction to some extent. *Style* covers both and more, referring not only to the words and the manner in which they are combined, but to everything that relates to the form in which thought is expressed, including peculiarities more or less personal to the writer or speaker.

The book of Job, indeed, in conduct and *diction*, bears a considerable resemblance to some of his [Milton's] dramas. *Macaulay*, Milton.

Exactly equiv. in etymological meaning are *vocabulary*, *lexicon*, and *word-book*.] **I.** *n.*; pl. *dictionaries* (-riz). A book containing either all or the principal words of a language, or words of one or more specified classes, arranged in a stated order, usually alphabetical, with definitions or explanations of their meanings and other information concerning them, expressed either in the same or in another language; a word-book; a lexicon; a vocabulary: as, an English *dictionary*; a Greek and Latin *dictionary*; a French-English or an English-French *dictionary*. In the original and most usual sense a dictionary is chiefly linguistic and literary, containing all the common words of the language with information as to their meanings and uses. In addition to definitions, the larger dictionaries include etymologies, pronunciation, and variations of spelling, together with illustrative citations, more or less explanatory information, etc. Special or technical dictionaries supply information on a single subject or branch of a subject: as, a *dictionary* of medicine or of mechanics; a biographical *dictionary*. A dictionary of geography is usually called a *gazetteer*.

Whitney, Encyc. Brit., XVIII. 767.

2. In *law*, an opinion of a judge which does not embody the resolution or determination of the court, and is made without argument, or full consideration of the point, and is not the professed deliberate determination of the judge himself. *Chief-Justice Folger.*—**3.** In *logic*, that part of a modal proposition which consists of the proposition to which the modality is applied.

It is necessary that God be good. The *dictum* is that God be good, the mode, necessary.
Burgersdicius, tr. by a Gentleman.

Dictum de omni et de nullo (concerning every and none), the rule of direct syllogism that if all A is B and all B is C, then all A is C. Some logicians render this as comprising two dicta: the *dictum de omni*, that whatever is true of all is true of each, and the *dictum de nullo*, that whatever is true of none is false of each. The canon is given by Aristotle.—**Dictum of Kenilworth**, an award designed for the pacification of the kingdom, made between King Henry III. of England and Parliament in 1266, during the siege of Kenilworth. It is published among the statutes of the realm, I. 12.—**Dictum simpliciter.** See *simpliciter*.—**Obiter dicta**, legal dicta (def. 2) uttered by the way (*obiter*), not upon the point or question pending, as if turning aside for the time from the main topic of the case to collateral subjects.=**Syn. 1.** *Aphorism*, *Axiom*, *Maxim*, etc. See *aphorism*.

Dictyograptus (dik'ti-ọ-grap'tus), *n.* [NL., < Gr. *δίκτυον*, a net, + NL. *Graptus*.] A genus of widely distributed and important fossils, originally described by Eichwald under the name of *Gorgonia flabelliformis*, and later by Hall under that of *Dictyonema*, and by him at that time (1852) considered to be corals, having a structure similar to that of *Fenestella*. Later the name *Dictyograptus* was substituted for *Dictyonema*. This fossil has been considered by some as a plant, but is now referred to the graptolites, from which it differs but slightly, if at all. *Dictyograptus* is "one of the most characteristic fossils of the primordial zone of Scandinavia" (*Geikie*), and is found in many localities in the shales of the Niagara group, from Rochester to the Niagara river.

Dictyophyllum (dik'ti-ọ-fil'um), *n.* [NL., < Gr. *δίκτυον*, net, + *φύλλον* = L. *folium*, leaf.] A genus of fossil ferns established by Lindley and Hutton, remarkable for its double system of nervation, consisting of a system of larger meshes inclosing another system of smaller ones, the whole bearing considerable resemblance to leaves of dicotyledonous plants. Hence some fossil leaves really belonging to the dicotyledons have, probably by mistake, been referred to this genus. Some authors are at present inclined to regard *Dictyophyllum* as a convenient name under which to place the description of fragments of doubtful character considered as belonging to the ferns. See *Idiophyllum* and *Phyllites*.

Dictyophyton (dik-ti-of'i-ton), *n.* [NL., < Gr. *δίκτυον*, a net, + *φυτόν*, a plant.] The name given by Hall to a genus of remarkable fossils of obscure affinities, which have been compared with algæ of the family *Dictyoteæ*. It is also considered as being closely related to, or identical with, the genus *Uphantænia* of Vanuxem. The latter genus exhibits itself in the form of circular or flabellate fronds, made up of ligulate, radiating, and concentric bands or striæ, which have the appearance of being interwoven like basketwork. With these flabellate forms are associated others which are conical or cylindrical, marked externally by cross striæ which divide the surface into rectangular spaces, and sometimes covered with long tubercles arranged in vertical and transverse rows. These latter forms are those which Hall included under the generic name of *Dictyophyton*. They are found in the Chemung group (Devonian) in New York, and in the Waverly group (Lower Carboniferous) of Ohio.

Dictyoptera (dik-ti-op'tę-rą), *n. pl.* [NL., < Gr. *δίκτυον*, a net, + *πτερόν*, a wing.] A group of cursorial orthopterous insects, the cockroaches, *Blattidæ* or *Blattina*, elevated to the rank of an order. *Leach*; *Burmeister.*

It is abundant in the coal-measures of Europe and the United States.

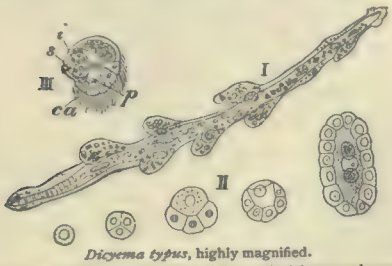
Dictyopyge (dik'ti-ọ-pī'jē), *n.* [NL., < Gr. *δίκτυον*, a net, + *πυγή*, buttocks.] A genus of Triassic ganoid fishes, remains of which occur in the coal-fields of Virginia: so called from the reticulated appearance of the large anal fin. *Lyell*, 1847.

Dictyotaceæ (dik'ti-ọ-tā'sē-ē), *n. pl.* [NL., < Gr. *δικτυωτός*, netted, latticed (< *δίκτυον*, a net), + *-aceæ*.] An order of olive-brown algæ with expanded membranous fronds. In their reproductive characters they are intermediate between the *Floridæ* on the one hand and the *Fucaceæ* and *Phæosporeæ* on the other.



Dictyoteæ (dik-ti-ō'tē-ē), *n. pl.* [NL., < Gr. *δικτυωτός*, netted, latticed, + *-eæ*. See *Dictyotaceæ*.] Same as *Dictyotaceæ*.

The leaf-scars of dictyoxylon are subpentagonal in form, broader than they are long, and have a slight groove at the upper end.

dicyan, dicyanogen (dī-sī'an, dī-sī-an'ō-jen), *n.* [< *di-*[2] + *cyan(ogen).*] See *cyanogen.*

The body consists of an elongated axial cell extending from one end to the other, invested in a single layer of comparatively small, flattened, nucleated, and ciliated cortical cells arranged like a pavement epithelium around the axial cell, the anterior of these, or polar cells, being distinguished from the succeeding or parapolar cells. The organism is a simple cell-aggregate, without connective, muscular, or nervous tissues. Reproduction takes place by the formation of germs on the axial cell. The embryos are of two different kinds, vermiform and infusoriform, whence the name. Those *Dicyemida* which give rise to the former kind are termed *Nematogena*, the others *Rhombogena.*

Dicyemidæ (dis-i-em'i-dē), *n. pl.* [NL., < *Dicyema* + *-idæ.*] Same as *Dicyemida.*

Dicynodon (dī-sin'ō-don), *n.* [NL., < Gr. *δι-*, two-, + *κυων* (*κυν-*), dog (= E. *hound*), + *ὀδους* (*ὀδοντ-*) = E. *tooth.*] The typical genus of *Dicynodontidæ.* Remains of species have been found in southern Africa, in the Ural mountains, and in India, in strata supposed to be of Triassic age.

Didelphia (dī-del'fi-ä), *n. pl.* [NL., < Gr. *δι-*, two-, + *δελφύς*, womb. Cf. *Didelphys.*] The *Marsupialia* or marsupial implacental mammals; one of the three subclasses of *Mammalia*, the other two being *Ornithodelphia* and *Monodelphia.* They have no placenta, and the womb double, whence the name — that is, the uterine dilatations of the oviducts continue through life distinct from each other, right and left, and open into two distinct vaginæ, which debouch in turn into a urogenital sinus, forming, with the termination of the rectum, a common cloaca embraced by the external sphincter muscle, and in the male lodging the penis, which thus appears to protrude from the anus. The female has usually an abdominal pouch or marsupium, formed by a fold of the skin of the belly, in which the mammary glands open, and into which the blind, naked, and imperfectly developed young are received and carried for some time hanging to the nipples. The scrotum of the male occupies a similar position. Both the marsupium and the scrotum are supported to some extent by the marsupial bones characteristic of this group, being ossifications in the tendon of the external oblique muscle of the abdomen, articulated with the pubes. A cremasteric muscle in relation with these bones acts in the female upon the mammary glands, effecting their compression, and consequently the flow of milk into the mouths of the helpless young. There are true teeth of two or three kinds. The coracoid is reduced to a process of the scapula, as in ordinary mammals, not reaching the sternum, as in monotremes. The corpus callosum is rudimentary or wanting, and the brain relatively small. The *Didelphia* are among the oldest known mammals, and formerly had an extensive range, but are now mainly confined to the Australian region, the American opossums offering the principal exception. Some of the extinct forms were of great size; the kangaroos are the largest living representatives. The marsupials are notable for their great physiological adaptation to all the modes of life of ordinary mammals, their structure being modified in relation to the carnivorous, the herbivorous, the rodent, and other habitudes, and their modes of progression and general economy being no less diverse. There is but one order, *Marsupialia* (which see).

Middleton and Rowley, Changeling, iv. 1.

Or to a tavern fine?

Professed gamblers . . . will not trust to the determination of fortune, but have recourse to many nefarious arts to circumvent the unwary; hence we hear of *loaded dice*, and dice of the high cut.
Strutt, Sports and Pastimes, p. 404.

Open-die machine, a screw-threading machine having movable cutting-dies fitting in blocks in the traveling die-head, thus saving time in fitting in different dies. An insertable steel block with a universal clinch to hold taps is provided for converting the machine quickly into a nut-tapper.—**The die is cast,** the affair is decided; the fate of the person or thing in question is settled; there is no recalling the act.—**The whole box and dice,** the whole number of persons or things. There are half a dozen species, of which two, *D. Seguine* and *D. picta*, are well-known decorative plants in greenhouses, varying exceedingly in the color and form of the foliage. The roots, as in many other plants of the order, are very acrid and caustic, and the name *dumb-cane* has been given to *D. Seguine* in the West Indies, from its effect upon the speech when its root is bitten.

See *residual*.—**Dielectric capacity.** Same as *specific inductive capacity* (which see, under *capacity*).

II. *n.* A substance through or across which electric force is acting. The walls of a Leyden jar; the intervening medium, solid, liquid, or gaseous, between the plates of a condenser; and the insulating sheath around the conductor of a telegraph-cable, are examples of dielectrics. Electric induction across a dielectric causes a stress in it which, if great enough, will produce rupture. The maximum intensity of this stress which the material can bear is called its *dielectric strength*. When the dielectric strength of the air between two clouds, or between a cloud and the earth, is unable to withstand the electric forces, a flash of lightning takes place. The fracture of stones in buildings, of trees, etc., in a thunderstorm are illustrations of the effect of excessive dielectric stress.

Until this subject [induction] was investigated by Faraday, the intervening non-conducting body or *dielectric* was supposed to be purely negative, and the effect was attributed to the repulsion at a distance of the electrical fluid. Faraday showed that these effects differed greatly according to the *dielectric* that was interposed.
W. R. Grove, Corr. of Forces, p. 85.

Dielytra (dī-el′i-trä), *n.* [NL., < Gr. *δι-*, two-, + *ἔλυτρον*, sheath, shard: see *elytrum*.] Same as *Dicentra*.

See *dialysis* and *distraction*, 8.—**2.** The sign (¨) regularly placed over the second of two contiguous vowels to indicate that they are pronounced separately; the same sign used for other purposes. The dieresis is used most frequently over *e* preceded by *a* or *o*, in distinction from the diphthongs or digraphs *æ* and *œ*. In Greek manuscripts these dots were frequently written over ι and υ beginning a word or a syllable, thus serving also to show that they did not form the close of a diph-

thong (αι, ει, οι, υι, αυ, ευ, ου), and their modern use is an extension of this. The employment of the dieresis to mark the full pronunciation of the letters *-ed*, as termination of the preterit and past participle (for instance, *praisèd*), though sometimes seen, is not established usage, the acute or grave accent being more common. A similar sign consisting of dots is used merely as a diacritical mark, as in the notation of pronunciation in this book (for instance, *a*, *o*, *u*). A similar mark is used in German to indicate the umlaut. See *umlaut*.

Japonica* of eastern Asia, many showy varieties of which are frequent in cultivation, more usually known as species of *Weigela*.

Difference is the same that is spoken of many, which differ in fourme and kinde, when the question is asked, What maner of thing it is, as when we saie: What maner of thing is man? We must aunswere: he is endued with reason: If the question be asked, what a man is: We must aunswere by his Genus, or generall woorde, he is a living creature. If the question be asked, what maner of thing a Beast is? We maie saie: He is without the gift of reason. The first five words express the fact of unlikeness; *difference* and *distinction* apply also to that wherein the unlikeness lies, and *discrimination* to the act of making or marking a difference, and to the faculty of discerning differences. (See *discernment*.) *Distinction* applies also to the eminence conferred on account of difference. *Difference* is the most general, applying to things small or great, internal or external. *Distinction* is generally, but not always, external, and generally marks delicate differences: as, the *distinction* between two words that are almost synonymous. *Diversity*, by its derivation, is a great or radical difference, equal to going in opposite directions. *Dissimilarity* is unlikeness, generally in large degree or essential points. *Disparity* is inequality, generally in rank or age. *Disagreement* and *variance* are weak words by their original meaning, but through euphemistic use have come to stand for dissimilarity of opinion of almost any degree, and for the resulting alienation of feeling, or even dissension and strife.

[When in the predicate, *different* is either used absolutely: as, the two things are very *different*; or followed by *from*: as, the two things are very *different from* each other; he is very *different from* his brother. But the relation of opposition is often lost in that of mere comparison, leading to the use of *to* instead of *from*. This use is regarded as colloquial or incorrect, and is generally avoided by careful writers.

Different to is, essentially, an English colloquialism; and, like many colloquialisms, it evinces how much stronger the instinct of euphony is than the instinct of scientific analogy. *F. Hall*, Mod. Eng., p. 83.

An amazement which was very *different to* that look of sentimental wonder. *Thackeray*, Vanity Fair, p. 182.]

=**Syn.** *Different*, *Distinct*, *Separate*, *Several*. These words agree in being the opposite of *same*. *Different* applies to nature or quality as well as to state of being: as, the African and Asiatic climates are very *different*. The other three words are primarily physical, and are still affected by that fact: we speak of *distinct* or *separate* ideas, colors, sounds, etc. *Several* is used chiefly of those things which are in some sense together without merging their identity: as, three *several* bands.

For electric motors it is a series winding carrying current in a direction opposite to that in the shunt winding.

II. *n.* **1.** In *math.*: (*a*) An infinitesimal difference between two values of a variable quantity. In the differential and integral calculus, if two or more quantities are dependent on one another, and subject to variations of value, their corresponding differentials are any other quantities whose ratios to one another are the limits to which the ratios of the variations approximate, as these variations are reduced nearer and nearer to zero; but the differentials are commonly understood to be infinitesimal. See *interference.*

Diffraction Bands.

Thus, if a beam of monochromatic light is passed through a narrow slit and received on a screen in a dark room, a series of alternately light and dark bands or fringes is seen, which diminish in intensity and distinctness on either side of the central line; if white light is employed, a series of colored spectra of different orders is obtained. Similar phenomena of diffraction are obtained from diffraction gratings, which consist of a band of equidistant parallel lines (from 10,000 to 30,000 or more to the inch), ruled on a surface of glass or of polished metal; the spectra obtained by this means are called *interference or diffraction spectra.* They differ from prismatic spectra, since in them the colors are uniformly distributed in their true order and extent according to their difference in wave-length; while in the latter the less refrangible (red) rays are crowded together, and the more refrangible (blue, violet) are dispersed. Diffraction gratings are now much used, especially in studying the solar spectrum. The best gratings are ruled on speculum metal with a concave surface (often called *Rowland gratings*, after Professor Henry A. Rowland of Baltimore), and give an image of the spectrum directly, without the intervention of a lens.

(*a*) The gradual and spontaneous molecular mixing of two fluids which are placed in contact one with the other. It takes place without the application of external force and even when opposed by the action of gravity. It is explained by the motion and mutual attraction of the molecules of the two fluids. Diffusion is most rapid and marked between gases, but is also an important phenomenon of liquids. See *diffusion of gases* and *diffusion of liquids*, below.

The process of *diffusion* is one which is continually performing an important part in the atmosphere around us. Respiration itself, but for the process of *diffusion*, would fail in its appointed end.
W. A. Miller, Elem. of Chem., I. iii. § 3.

(*b*) A scattering, dispersion, or dissemination, as of dust or seed, or of animals or plants.

The process of *diffusion* would often be very slow, depending on climatal and geographical changes, on strange accidents, and on the gradual acclimatization of new species to the various climates through which they might have to pass. *Darwin*, Origin of Species, p. 305.

(*c*) Propagation or spread, as of knowledge or doctrine.

Another measure of culture is the *diffusion* of knowledge. *Emerson*, Civilization, p. 21.

Diffusion of force, the phenomena of viscosity in moving fluids.—**Diffusion of gases**, the diffusion through each other which takes place when two bodies of gas are placed in contact, as when a bell-jar of hydrogen is placed base to base over one containing oxygen. After a certain time a homogeneous mixture is obtained, even if the heavier gas is placed below. When separated by a porous diaphragm the relative rate of diffusion can be measured (see *diffusiometer*); it is found to be the more rapid with the lighter gas.—**Diffusion of heat.** (*a*) A phrase employed to express the modes by which the equilibrium of heat is effected, viz., by conduction, radiation, and convection. The term is also used, like *diffusion of light* (see *light*), to describe the irregular reflection or scattering of the incident heat (and light) from the surface of a body not perfectly smooth. (*b*) Conduction of heat.—**Diffusion of liquids**, the diffusion through each other which occurs when two liquids that are capable of mixing, such as alcohol and water, are placed in contact, even in spite of the action of gravity. It is closely related to the phenomena of exosmosis and endosmosis (which see), which take place when the liquids are separated by a porous diaphragm. See also *dialysis*.—**Diffusion of taxes**, the theory that the community as a whole must bear the burden of any tax, no matter upon what commodity or persons it is originally levied. This theory rests on the assumption of perfect competition.—**Diffusion tube**, an instrument for determining the rate of diffusion for different gases.=**Syn.** Spread, circulation, expansion, dissemination, distribution.

It was a consonant, and appears to have had the force of the English *w*. It went out of use with the disappearance of the sound signified by it from Greek pronunciation, but is restorable on metrical and other evidence in many ancient Greek words, especially in Homer.

It. *digastrico*, < NL. *digastricus*, < Gr. δι-, two-, + γαστήρ, belly.] **I.** *a.* In *anat.*: (*a*) Having two fleshy bellies with an intervening tendinous part, as a muscle: as, the omohyoid, the biventer cervicis, etc., are *digastric* muscles. II. *n.* A muscle of the lower jaw: so called because in man it has two bellies. In its generalized condition it is a principal depressor of the lower jaw, opening the mouth and antagonizing the temporal and masseteric muscles. It arises from the back part of the skull, and is inserted into the mandible. In man and many other animals (though not in most) it becomes digastric or double-bellied, the intervening tendon being bound by an aponeurotic loop to the hyoid bone, and the muscle thus becoming an elevator of the hyoid as well as a depressor of the jaw. It arises from the digastric groove of the mastoid, and is inserted into the symphysis menti. With the lower border of the jaw its two bellies, which meet at an angle, bound the surgical triangle of the neck known as the submaxillary space.

(*d*) A strong close vessel, in which bones or other substances may be subjected, in water or other liquid, to a temperature above that of boiling. It is made of iron or other metal, with an air-tight lid, in which is a safety-valve. In this vessel animal or other substances are placed, and submitted to a higher degree of heat than could be obtained in open vessels, by which means the solvent power of the liquid is greatly increased. It is called in this form (first described in 1681) *Papin's digester*, from its inventor, Denis Papin, a Frenchman. The principle is applied in other forms, and by it various useful products are obtained on a large scale from animal carcases unfit for other use. In other kinds of digesters the operation is chemical, and does not imply the extreme pressures employed in that above described. Thus, in one kind, nut-galls or other vegetable products are placed in a vessel and saturated with ether; the volatile extract falls in minute drops into a closed vessel below, which is connected by means of a pipe with the top of the upper vessel to prevent the escape of the ether. See *rendering-tank*. Also *digestor*.

2. The physiological process of converting the food from the state in which it enters the mouth to that in which it can pass from the alimentary canal into the blood-vessels and lymphatics. The principal features of the process, apart from the comminution of the food, are the conversion of starch into sugar and of proteids into peptones, and the emulsionizing of the fats. These changes are effected by the action of soluble ferments furnished by the salivary glands, the gastric glands, the pancreas, and the intestinal glands. The bile is also of service, especially in the emulsionizing of the fats.

digger (dig'ėr), *n.* [< ME. *diggere*; < *dig* + *-er*[1]. Cf. *diker*, *ditcher*.] 1. A person or an animal that digs; an instrument for digging.—2. [*cap.*] One of a degraded class of Indians in California, Nevada, and adjacent regions, belonging to several tribes, all more or less intimately connected with the Shoshones: so called because they live

chiefly upon roots dug from the ground. Collectively called *Digger Indians.*

Among all these Indians the most miserable are the root-*diggers*, who live almost entirely on the scanty roots of plants which are found in the ravines or plains. These poor wretches suffer all the hardships of hunger and want. They are compelled to spend two thirds of the year among the mountains, with no other resource than a little fish and roots. When both these provisions fail, it is impossible to picture the wretched state of these pariahs of the wilderness. Yet they are not downcast; they are ever cheerful, and endure their suffering with dignity. They are open and sociable with strangers and perfectly honest in their transactions.

Abbé Domenech, Deserts of North America (trans.), II. 60.

Not "an argument in which the adversary is 'caught between' (*διαλαμβάνεται*) two difficulties," nor derived from *διαλαμβάνεσθαι*, be caught between.] **1.** A form of argument in which it is shown that whoever maintains a certain proposition must accept one or other of two alternative conclusions, and that each of these involves the denial of the proposition in question. The alternatives are called the *horns of the dilemma*, which is also called a *horned syllogism*. The argument is also called a dilemma, in a looser sense, when the number of such horns exceeds two. The dilemma originated in rhetoric, and was not noticed by logicians before the revival of learning; consequently there has been some dispute as to its logical definition and analysis. The standard example (from Aulus Gellius) is as follows: Every woman is fair or ugly; it is not good to marry a fair wife, because she will flirt; it is not good to marry an ugly wife, because she will not be attractive; therefore, it is not good to marry at all. The essential peculiarity of this reasoning is that it involves the principle of excluded middle, the falsity of which would leave ordinary syllogism intact. Logicians, however, have made the dilemma a matter of form of expression, saying that the above argument, for instance, is not a dilemma as long as the first premise reads as above, but that it becomes one if that premise is put in this form: If it is good to marry, it is good to marry a fair wife, or it is good to marry an ugly wife. They have at different times recognized the following forms as dilemmas or as parts of dilemmas, for many logicians hold that a dilemma consists of three syllogisms: (1) *Simple constructive dilemma:* If A, then C; if B, then C; but either B or A; hence, C. (2) *Simple destructive dilemma:* If A is true, B is true; if A is true, C is true; B and C are not both true; hence, A is not true. (3) *Complex constructive dilemma:* If A, then B; if C, then D; but either A or C; hence, either B or D. (4) *Complex destructive dilemma:* If A is true, B is true; if C is true, D is true; but B and D are not both true; hence, A and C are not both true. The importance of the kind of reasoning now called *dilemma* was first strongly insisted upon by the Stoics. Nevertheless, in the Stoical terminology a *dilemma* is opposed to a *monolemma*, as a conclusion from two premises. This was the origin of the word, and it is only later that it is met with in the modern sense.

Dilemma is an argument made of two members, repugnant one to another, wherof which soever thou grantest, thou art by and by taken. *Blundeville*, Logic, v. 27.

diluvianism (di- or dī-lū'vi-an-izm), *n.* [< *diluvian* + *-ism*.] A geological theory which is largely based on the supposition of the former occurrence of a universal deluge. In the early history of geology the deluge played an important part, and many leading facts were explained by reference to it.

Linguistic philology has been actually created by it [the scientific movement of the age] out of the crude observations and wild deductions of earlier times, as truly as chemistry out of alchemy, or geology out of *diluvianism*. *Whitney*, Encyc. Brit., XVIII. 765.

diluviate† (di- or dī-lū'vi-āt), *v. i.* [< L. *diluviatus*, pp. of *diluviare*, overflow, deluge, < *diluvium*, a flood, deluge: see *diluvium*, and cf. *deluge*, *v.*] To overflow; run, as a flood.

E. *deluge*, q. v.), < *diluere*, wash away: see *dilute*.] **1.** A deluge or an inundation; an overflowing.—**2.** Coarse detrital material, wherever found: a term introduced into geology in consequence of a general belief in the past occurrence of a universal deluge. Finer materials, usually occupying the lower parts of valleys, and occurring especially along the courses of great rivers, were called *alluvium* (which see). In the use of the words *diluvium* and *alluvium* (*diluvial*, *alluvial*) there is an obscure recognition of a fundamental fact in geology, namely, that rivers have been gradually diminishing in volume, a condition which necessarily connects itself with diminished erosive power. But the idea of a catastrophic period of diluvial action, preceded and followed by repose, such as lies at the base of the belief in the deluge, is no longer in vogue, and the word *diluvium* has become almost obsolete except among German geologists.

dimaris, dimatis (dim'a-ris, -tis), *n.* [An artificial term.] The mnemonic name of that mood of the fourth figure of syllogism which has affirmative propositions for its premises, one universal, the other particular. The oldest name for this mood seems to have been *drimatis*, of which *dimatis* is an improvement, and *dimaris* is now most commonly in use. The following is an example of this mood: Some commendable actions are recognized by the political economists; but every action recognized by the economists is a selfish one; therefore, some selfish actions are commendable. The letters of the word have the following significations: *i*, *a*, and *i* show the quantity and quality of the propositions; *d*, that the reduction is to *darii*; *m*, that the premises are transposed in reduction; *s*, that the conclusion of the reduction is to be simply converted. Thus, a line has one dimension, length; a plane surface two, length and breadth; and a solid three, length, breadth, and thickness. The number of dimensions being equal to the number of principal axes, and that to the number of independent directions of extension, it has become usual, in mathematics, to express the number of ways of spread of a figure by saying that it has two, three, or *n* dimensions, although the idea of measurement is quite extraneous to the fact expressed. The word generally occurs in the plural, referring to length, breadth, and thickness.

So doe those skils, whose quick eyes doe explore
The just *dimension* both of earth and heaven.
Sir J. Davies, Dancing, st. 95.

A dark
Illimitable ocean, without bound,

These as a line their long *dimension* drew,
Streaking the ground with sinuous trace.
Milton, P. L., vii. 480.

Hence **—2.** A mode of linear magnitude involved (generally along with others) in the quantity to which it belongs. (*a*) In *alg.*, a variable factor, the number of dimensions of an expression being the number of variable factors in that term for which this number is the largest. (*b*) In *phys.*, a linear measure of length, time, mass, or any kind of quantity regarded as a fundamental factor of the quantity of which it is a dimension. If M, L, T, are the units of mass, length, and time, the *dimensions* of a velocity are said to be LT^{-1}, or one dimension of length and minus one of time; those of an acceleration are said to be LT^{-2}; those of a momentum, MLT^{-1}; those of a force, MLT^{-2}; those of a quantity of energy, ML^2T^{-2}; those of the action of a moving system, ML^2T; those of a horse-power, ML^2T^{-3}; those of a pressure, $ML^{-1}T^{-2}$; those of a density, ML^{-3}; etc.

Gray*, Struct. Bot., p. 225.

4. In *zoöl.*, difference of form, structure, size, coloration, etc., between individuals of the same species. Sexual dimorphism is the rule in the animal kingdom; and differences between the male and female other than in the sexual organs, as well as constant differences between individuals of each sex, without reference to sex, are instances of dimorphism.

Dimorphism is thus seen to be a specialized result of variation, by which new physiological phenomena have been developed. *A. R. Wallace*, Nat. Select., p. 158.

The phenomena of *dimorphism* and polymorphism in the same species, and the sexual differences which have been developed in animals originally hermaphrodite, may be quoted as important evidence of the extensive influence of adaptation. . . . The numerous cases of *dimorphism* and polymorphism in either sex of the same species should be regarded from the same point of view.
Claus, Zoölogy (trans.), I. 154.

The principal meal of the day, taken at midday or later, even in the evening. In medieval and modern Europe the common practice, down to the middle of the eighteenth century, was to take this meal about midday, or in more primitive times even as early as 9 or 10 A. M. In France, under the old régime, the dinner-hour was at 2 or 3 in the afternoon; but when the Constituent Assembly moved to Paris, since it sat until 4 or 5 o'clock, the hour for dining was postponed. The custom of dining at 6 o'clock or later has since become common, except in the country, where early dinner is still the general practice. See extract under *dinner-hour*.

And set tyll theyr *dynere*.

dinner-hour (din'ėr-our), *n.* The hour at which dinner is taken; dinner-time. See *dinner*.

The Court *dinner-hour*, in the reign of George III., was at the Hanoverian hour of four o'clock. During the reign of George IV. it gradually crept up to six o'clock, and finally became steady at the Indian hour of seven, and so remained until the reign of Her Most gracious Majesty, when the formal Court *dinner-hour* became eight o'clock. These innovations on the national hours of meals did not meet the approval of the medical faculty, and in consequence a dinette at two o'clock was prescribed. This has ever since been the favourite Court meal, being in reality a substantial hot repast, which has exploded the old-fashioned luncheon of cold viands.

Dinosauria (dī-nō-sâ'ri-ą), *n. pl.* [NL., less prop. *Deinosauria*, < *Dinosaurus*, q. v.] A group of extinct Mesozoic reptiles, mostly of gigantic or colossal size. They were characterized by distinctly socketed teeth; generally flat or slightly cupped vertebræ, some of which were opisthocœlous; a sacrum of four or more vertebræ; numerous caudal vertebræ; a structure of the skull in many respects intermediate between the crocodilian and lacertilian types; ambulatory or saltatory limbs; fore limbs reduced and not known to have had clavicles; and hind limbs usually disproportionately developed, and with the pelvis presenting a series of modifications tending toward the characters of birds, on which account the group is also called *Ornithoscelida* (which see). The ornithic structure of the legs is best seen in the smaller genera, such as *Compsognathus*; it is exhibited in the presence of a cnemial crest, the reduction of the distal end of the fibula, the disposition of the distal end of the tibia, and the relations of the astragalus. In some genera there was a bony dermal armor, in some cases developing great spines. The *Dinosauria* were a polymorphic as well as an extensive group, the limits of which are not settled, owing to the wide range of variation presented by them. They ranged in size from that of the huge iguanodon down to about two feet. By some they are supposed to have included the remote ancestors of birds; others find in them features that recall mammals, especially pachyderms. The order is by some divided into *Dinosauria* proper and *Compsognatha* (which see); it is sometimes ranked as a subclass of *Reptilia*, and divided into *Sauropoda*, *Stegosauria*, *Ornithopoda*, *Theropoda*, and *Hallopoda*.

It had (?) incisors in the upper and 2 in the lower jaw, no canines, 2 premolars and 3 molars in each half of each jaw—all in position at once, the premolars replacing milk molars as usual in diphyodont mammals—and enormous lower incisors, turned down or away from the mouth, the end of the under jaw being modified to correspond. There are several species, from the Miocene of Europe and Asia, the best-known of which is *D. giganteum*, from Epelsheim near Mainz, estimated to have been about 18 feet long.

Only one species is known, *D. muscipula* (Venus's fly-trap), a native of the sandy savannas of the Carolinas and Florida. It has a rosette of root-leaves, from which rises a naked scape bearing a corymb of rather large white flowers. The leaves have a dilated petiole and a slightly stalked 2-lobed lamina or appendage with three very delicate hairs and a fringe of stout marginal bristles on each lobe. The hairs are remarkably irritable, and when touched by a fly or other insect the lobes of the leaf suddenly close on the insect and capture it. This is followed by the copious secretion of an acid liquid for the digestion of the prey, and by its absorption. This may be repeated several times by the same leaf.

The Lesser Dionysia were a vintage-festival, celebrated through the rural demes in the month of Poseideon (December), with universal merriment and freedom from restraint, extended even to slaves. Plays were performed during this festival, and from its characteristic songs and jests comedy was developed. The Greater Dionysia were observed at Athens in the second half of March, with a grand procession, a set chorus of boys, and the production in competition at the expense of the state, in the Dionysiac theater, in honor of the god, of the comedies and tragedies of which those surviving constitute our most precious treasures of ancient literature. The genus *Dioönites*, as instituted by Bornemann, consists largely of species previously assigned by authors to *Pteraphyllum*.

Diophantine (dī-ō-fan′tin), *a.* [< LL. *Diophantus*, Gr. *Διόφαντος*, a proper name, + *-ine*[1].] Of or pertaining to Diophantus of Alexandria, a celebrated Greek arithmetician, who flourished in the fourth century.—**Diophantine analysis,** indeterminate analysis: a method of solving Diophantine problems, namely, of solving indeterminate algebraic equations, the solutions being rational numbers. The method consists in introducing an equation involving an indeterminate coefficient, in such a way that the square of one of the unknowns may be eliminated. It therefore depends upon the ingenuity and experience of the calculator. The following is an example: Required to separate a given square number, N^2, into the sum of two squares. Let x^2 be one of these squares, and let the root of the other be $ax - N$, where a is indeterminate. Then, the sum of the two squares will be $(1 + a^2)x^2 - 2aNx + N^2$. Since this is equal to N^2, we have $(1 + a^2)x = 2aN$, or $x = 2aN/(1 + a^2)$, which is rational.

Section of Fresnel's Dioptric Light.

II. *n.* A unit of refractive power of a lens (or inverse focal length), equal to unity divided by a meter. The numerical measure of the power of a lens expressed in dioptrics is the ratio of one meter to the focal length of the lens, the latter being measured positively in the direction away from the source of parallel rays entering the lens; so that a convex lens with a focal length of half a meter would have a power of 2 dioptrics, and a concave lens with a focal length of 250 millimeters would have a power of −4 dioptrics.

> Owing principally to differences in the length of the inch in various countries, this method [the inch being used as the unit] had great inconveniences, and is now giving place to a universal system, in which the unit is the refractive power of a lens whose focal length is one metre. This unit is called a *dioptric* (usually written "D"). *Encyc. Brit.*, XXII. 873.

A spectacular painting, or a connected series of paintings, intended for exhibition to spectators in a darkened room, in a manner to produce by optical illusions an appearance of reality. The paintings are so executed and arranged that a variety of effects may be induced by varying the direction, intensity, and color of the light; one of the most notable of these effects coming from light transmitted through the picture itself, which is painted in transparent coloring on a thin fabric. Different scenes may be painted on the two faces of the fabric, and a change from one to the other may be made by altering the source of the illumination. A daylight scene may be thus changed with wonderful realism to one by moonlight, or a desert place may become all at once peopled by a busy crowd. The diorama was devised in 1822 by Daguerre (the chief inventor of photography) and Bouton.

> Ye are not so pure and clean as ye ought to be, and free from the lusts of the flesh; which vice is here noted by Nicolaitism *dioristically*, as idolatry in general before by eating things sacrificed to idols. *Dr. H. More*, Epistles to the Seven Churches, p. 72.

Diorite consists essentially of a crystalline-granular aggregate of a triclinic feldspar and hornblende, in very varying proportions, with which are frequently associated magnetite and apatite, and sometimes mica. This rock has usually a thoroughly crystalline structure. Many of the rocks called by the name of *diorite* are, in all probability, altered basalts; some, however, may have resulted from the alteration of andesites, and even of gabbros. In the case of diorite, the alteration has proceeded further than it has in the diabases and melaphyres. See *greenstone* and *diabase*.

6. A pickpocket. [Thieves' slang.]—**Dip of the horizon,** the angular amount by which the horizon line lies below the level of the eye. It is otherwise termed the *inclination of the needle*. In the United States the dip of the needle varies from 55° to 70°; at the magnetic poles it is 90°, and on the magnetic equator it is 0°.—**Direction of the dip,** the point of the compass toward which a stratum of rock is inclined.

It is not infrequently followed by more or less extended paralysis. The air-passages of the head are the most frequent seat of the diphtheritic membrane, although it may appear on other mucous surfaces and in wounds. The disease is very frequently fatal, and its ravages are extended by filth. Also *diphtheritis*.

diphthong (dif'- or dip'thông), *n.* [Formerly also *dipthong*; = F. *diphthongue* = Pr. *diptonge* = Sp. *diptongo* = Pg. *diphthongo*, *ditongo* = It. *dittongo* = D. *diphthongus* = G. *diphthong* = Dan. In uttering a proper diphthong both vowels are pronounced; the sound is not simple, but the two sounds are so blended as to be considered as forming one syllable, as in *joy*, *noise*, *bound*, *out*. An "improper" diphthong is not a diphthong at all, being merely a collocation of two or more vowels in the same syllable, of which only one is sounded, as *ea* in *breach*, *eo* in *people*, *ai* in *rain*, *eau* in *beau*. (See *digraph.*) In Greek grammar, a proper diphthong is a diphthong the first vowel of which is short; an improper diphthong, a diphthong the first vowel of which is long. The proper diphthongs are *αι*, *ει*, *οι*, *αυ*, *ευ*, *ου*; the improper, *āι*, *ηι*, *ωι* (commonly written *ᾳ*, *ῃ*, *ῳ*: see *iota subscript*, under *subscript*), *ηυ*, *ωυ*. An improper diphthong not usually distinguished as such is *āυ*, as in *νᾱῦς*, Epic *νηῦς*. Some include *υι* in this class, and some limit the term to *αι*, *ηι*, *ωι*.

Whether there were any true *diphthongs* in Old-English, and if not, when they were introduced, is a question which cannot now be answered.

Gegenbaur, Comp. Anat. (trans.), p. 552.

II. *n.* A mammal which has two sets of teeth. Most mammals have a definite set of milk-teeth which are deciduous, and are displaced and replaced by a permanent set. The latter, as a rule, differ both numerically and otherwise from the former, particularly in the appearance of true molars, which are lacking in the milk-dentition. Thus, in a child there are 20 teeth, none of them molars proper; in the adult there are 32, an increase of three molars above and below on each side.

The distal set of appendages [in the calycophorans] is the oldest, and, as they attain their full development, each set becomes detached, as a free-swimming complex *Diphyzoöid*. In this condition they grow and alter their form and size so much that they were formerly regarded as distinct genera of what were termed monogastric Diphydæ.

diplanetism (dī-plan'e-tizm), *n.* [< *diplanet-ic* + *-ism.*] In *cryptogamic bot.*, the property of

being twice active, with an intervening period of rest. It occurs in the zoöspores of certain genera of *Saprolegnicæ*, in which the zoospores escape without cilia from the sporangium, and come to rest in a cluster, each forming a cell-wall. After some hours of rest the protoplasm of each spore escapes from its cell-wall, acquires cilia, and enters upon a period of active movement.

Diplarthrism appears in that foot before it does in the fore foot, as in the Proboscidia.
E. D. Cope, Amer. Nat., XXI. 988.

diplarthrous (dip-lär'thrus), *a.* [< NL. *diplarthrus*, < Gr. *διπλόος*, double, + *ἄρθρον*, joint.] Doubly articulated, as a bone of one row of carpal or tarsal bones with two bones of the other row; characterized by or exhibiting diplarthrism; not taxeopodous: as, a *diplarthrous* carpus or tarsus; a *diplarthrous* ungulate mammal.

It consists of an equilateral hollow prism, two of whose sides are silvered on the inside so as to be mirrors, while the third is formed of glass. The prism is adjusted so that one of the silvered sides shall be exactly in the plane of the meridian, and the transparent side toward the object. So long as the object has not reached the meridian, the image produced by that portion of the rays reflected directly from the glass surface, and that produced by the rays transmitted through the glass to the silvered side, reflected from it to the other, and thence through the glass, are not coincident, but gradually approach as the sun or star approaches the meridian, until they exactly coincide at the instant the center of the object is on the meridian; then an eye stationed at the side of the prism and looking toward the transparent side sees only one object.

The terms contraplex and *diplex* are here applied as specific names for designating clearly the way in which the particular simultaneous double transmission to which we wish to refer is effected. Thus, for instance, two messages may be sent over a single wire in the same or in opposite directions, and when we do not care to particularize either, we simply allude to them under the more common generic name of duplex transmission, which includes both. The skeleton is partially osseous, with persistent notochord; the heart has two auricles and one ventricle; there is a muscular conus arteriosus and spiral intestinal valve; the gills are free, with a narrow opening and rudimentary gill-cover; and the air-bladder is nearly or quite double, and developed into functional lungs permanently communicating with the esophagus. The body is covered with cycloid scales. The living *Dipnoi* are divisible into two groups, *Dipneumona* with paired lungs, and *Monopneumona* with a single lung of two symmetrical halves. Some old extinct relations are referred to another order (or suborder) called *Ctenodipterini,* by others endowed with the rank of a family only. Diptera (dip′tẹ-rạ), *n. pl.* [NL., neut. pl. of *dipterus*, two-winged: see *dipterous*.] **1.** An order of metabolous hexapod insects. They are two-winged insects, or flies, with two membranous wings with radiating nervures, not folded at rest, a posterior pair being only represented by halteres or poisers; no mandibles as such, but a suctorial proboscis instead, formed of modified mandibles, maxillæ, and the central labium, here called glossarium; usually two maxillary but no labial palpi; antennæ generally short; two large compound eyes, often of thousands of facets, and three ocelli or simple eyes; and the prothorax and metathorax reduced, the mesothorax being correspondingly developed. Metamorphosis is complete; the larvæ are apodal, or with only rudimentary feet; the pupæ are usually coarctate (see cut under *coarctate*), sometimes obtected. The common house-fly, blue-bottle, etc., are characteristic examples. The power which many of these insects have of walking on smooth surfaces with back downward is due to the construction of the feet, which act as suckers. They have, besides the ordinary two claws, several little cushions called pulvilli, beset with fine hairs expanded at their tips into a kind of disk; the adhesion is aided in some cases by a viscid secretion of these hairs. The order is a very large one: there are said to be 9,000 European species alone, supposed to be not a twentieth part of the whole number. About 4,000 are described as North American. A few are useful scavengers, but many are injurious insects, and some are great pests. Gnats, mosquitos, gad-flies, blow-flies, bot-flies, tzetzes, etc., belong to this order. It is variously subdivided, one division being into four suborders: the *Pupipara*, which are parasitic, and developed in the body of the parent, as the bee-lice; the *Brachycera*, or ordinary flies; the *Nemocera*, or crane-flies, gnats, midges, mosquitos, etc.; and the wingless *Aphaniptera*, or fleas, which are oftener ranked as a distinct order. Another division is into the suborders *Orthorhapha* and *Cyclorhapha*, according to the character of the metamorphosis: the former with two sections, *Nematocera* and *Brachycera*; the latter with also two sections, *Aschiza* and *Schizophora*.

(*c*) The intercessions in the course of which these names were introduced. The recitation of the name of any prelate or civil ruler in the diptychs was a recognition of his orthodoxy; its omission, the reverse. The mention of a person after death recognized him as having died in the communion of the church, and the introduction of his name into the list of saints or martyrs constituted canonization. In liturgics the diptychs are distinguished as *the diptychs of the living* and *the diptychs of the dead*, the latter including also the commemoration of the saints. In most liturgies the diptychs are included in the *great intercession* (see *intercession*). direct-action (di-rekt'ak'shon), *a.* In *mech.*, characterized by direct action: a term applied to engines which have the piston-rod or cross-head connected directly to, or by a connecting-rod with, the crank, dispensing with working-beams and side levers: as, a *direct-action* steam-engine. A rectilinear motion of the piston is insured by a cross-head at the end of the piston-rod, which slides in parallel guides, or, in the case of the oscillating engine, the cylinder vibrates in accordance with the movement of the crank. Special types of direct-action engines are the annular double-cylinder, double-piston, inclined-cylinder, inverted-cylinder, oscillating, sliding-cover, steeple-, and trunk-engines. Also applied to steam-pumps which have the steam-piston connected by the piston-rod directly to the pump-piston or plunger, and which have valve-gear that prevents stopping on what is called the *dead-center*. Such pumps work without cranks or fly-wheels.

Sw. *direktion*, < L. *directio*(*n*-), a making straight, a straight line, a directing (toward anything), < *dirigere*, pp. *directus*, direct: see *direct*.] 1. Relative position considered without regard to linear distance. The direction of a point, A, from another point, B, is or is not the same as the direction of a point, C, from another point, D, according as a straight line drawn from B through A and continued to infinity would or would not cut the celestial sphere at the same point as a straight line drawn from D through C and also continued to infinity. Every motion of a point has a determinate direction; for if any motion from any instant were to lose all curvature, it would tend toward a determinate point of the celestial sphere, which would define its direction at the instant when it ceased to be deflected. It is inaccurate to say that a line has a determinate direction, because a motion along that line has either one of two opposite directions. Yet the word *direction* is sometimes used in a loose sense in which, opposite directions not being distinguished, the direction of a line is spoken of, meaning the pair of opposite directions.

The *direction* of a star is seen at a glance, while the most profound science and the most accurate observations have not enabled the astronomer to ascertain its distance.
B. Peirce.

Thus, if a body falls freely by gravity, its line of direction is a line perpendicular to the horizon, or one which, if produced, would pass through the earth's center. (2) A line drawn from the center of gravity of any body perpendicular to the horizon. =Syn. 2. Oversight, government, control.

directly (di-rekt'li), *adv.* 1. In a straight line or course, literally or figuratively; in the natural and primitive way: as, aim *directly* at the object; gravity tends *directly* to the center of the earth. In mechanics a body is said to strike or impinge directly against another when the stroke is in a direction perpendicular to the surface at the point of contact. Also, a sphere is said to strike directly against another when the line of direction passes through both their centers. The principal ecclesiastical directories are: (1) The set of rules drawn up in 1644 by the Westminster Assembly of Divines, to take the place of the Book of Common Prayer of the Church of England, ratified by Parliament in 1645, and adopted by the Scottish General Assembly the same year. (2) In the *Rom. Cath. Ch.*, a list, drawn up by authority of the bishop, containing directions as to the mass and office to be said on each day of the year. It occurs in all birds' eggs, in which the round, flat germ-disk, commonly called the *cicatricula* or *tread*, may be observed upon the surface of the yellow. In impregnated eggs, even when freshly laid, the germ-disk may be resolved by moderate magnifying power into a flattened mass of little cells which have already arisen by this form of cleavage of the original parent-cell or discocytula, and have become a discomorula, or even advanced to the stage of a discoblastula or discogastrula.—**Discoidal epipleuræ**, in *entom.*, borders of the elytra which are strongly deflexed, appearing like processes of the lower surface of the disk. *Kirby.*—**Discoidal nervures,** in *entom.*, the nervures in the center of the wing, entirely unconnected with other nervures, as in certain *Coleoptera*.—**Discoidal placenta**, a placenta or afterbirth which has the form of a circular flattened cake, as that of man, monkeys, bats, insectivores, and the rodents.

Discomedusæ (dis″kō-mē-dū′sē), *n. pl.* [NL., pl. of *Discomedusa.*] An order of the class *Hydrozoa* and subclass *Scyphomedusæ*, including the discophorous hydrozoans, or *Discophora* in a strict sense, as those acalephs commonly called jelly-fishes: so called from the large umbrella-like disk which these organisms possess. Most jelly-fishes belong to this order. They are technically characterized as *Scyphomedusæ* which develop as sexual medusiform individuals by transverse fission from a scyphistoma (which see), or else directly from the egg: with 4 perradial, 4 interradial, and sometimes accessory adradial tentaculicysts; 4 or 8 genital lobes developed from the endoderm forming the oral floor of the enteric cavity, which is extended into 4 or 8 pouches; and with the mouth either opening simply at the end of a rudimentary manubrium or provided with 4 or 8 arm-like processes. According to the character of the mouth, the *Discomedusæ* are divided into three suborders, *Cubostomæ*, *Semostomæ*, and *Rhizostomæ*. To the last of these belongs the genus *Cephea*. (See cut under *Discophora*.) The order as here defined is contrasted with the three orders *Lucernariæ*, *Conomedusæ*, and *Peromedusæ*, and is included with them in the subclass *Scyphomedusæ*. Characteristic genera of discomedusans are *Discomedusa* and *Nausithoë* among the simple cubostomous forms; the semostomous *Chrysaora*, *Pelagia*, *Cyanea*, and *Aurelia*; and the rhizostomous *Cephea*, *Cassiopeia*, and *Rhizostoma*. The term *Discomedusæ* has also been wrongly extended to other scyphomedusans, thus becoming synonymous with the subclass *Scyphomedusæ*, or with *Discophora* in one of its senses.

The griding sword with *discontinuous* wound
Pass'd through him. *Milton*, P. L., vi. 329.

3. In *math.* See the extract.

The term *discontinuous*, as applied to a function of a single variable, has been used in two totally different senses. Sometimes a function is called *discontinuous* when its algebraic expression for values of the variable lying between certain limits is different from its algebraical expression for values of the variable lying between other limits. Sometimes a function of x, $f(x)$, is called continuous when, for all values of x, the difference between $f(x)$ and $f(x+h)$ can be made smaller than any assignable quantity by sufficiently diminishing h, and in the contrary case *discontinuous*. If $f(x)$ can become infinite for a finite value of x, it will be convenient to consider it as *discontinuous* according to the second definition. *Stokes.*

discontinuously (dis-kon-tin′ū-us-li), *adv.* In a discontinuous manner; with discontinuity.

The figure-discs must be driven *discontinuously*. *Sir E. Beckett*, Clocks and Watches, p. 144.

Discophora (dis-kof′ọ-rä), *n. pl.* [NL., neut. pl. of *discophorus*: see *discophorous*.] **1.** The discoidal hydrozoans, a subclass of *Hydrozoa*, comprising most of the organisms known as jellyfishes, sea-jellies, or sea-nettles. The latter name is given them from the power they possess, like other hydrozoans, of stinging by means of their thread-cells. The hydrosome consists of a single umbrella-like disk, by the rhythmical contraction of which the creature swims, and from the center of which hangs a single polypite or digestive individual, or, less frequently, several. They are free-swimming oceanic animals, whose body consists of such soft gelatinous substance that a specimen weighing several pounds when alive weighs when dried hardly as many grains. The *Discophora* include many acalephs, in the usual sense of that term, and are also called *Medusæ*, *Ephyromedusæ*, and *Acraspeda*. They have been divided into *Calycozoa* (lucernarians), *Rhizostomea*, and *Monostomea*. The term *Discophora* is also restricted to the last two of these, excluding the *Lucernarida*. Thus, by Claus, the *Discophora* are made a suborder of *Scyphomedusæ*, synonymous with *Acraspeda*, and characterized as disk-shaped acalephs with the margin of the disk 8-lobed, at least 8 submarginal sense-organs, as many ocular lobes, and 4 great cavities in the umbrella for the generative organs. In this strict sense the *Discophora* correspond to the *Discomedusæ* (which see). For several wider and inconsistent uses of the term, see the extract.

Cephea, one of the *Discophora*.

a, disk, or umbrella; *b*, ramifications of the brachia which terminate in *c*, the tentacles; *O*, pillars supporting the brachiferous disk which floors the subumbrellar cavity; *l*, short clavate tentacles between the oral pores.

The binary division of the Hydrozoa was established by Eschscholtz (1829), whose Discophoræ phanerocarpæ correspond to the Scyphomedusæ, whilst his Discophoræ cryptocarpæ represent the Hydromedusæ. The terms point to distinctions which are not valid. In 1853 Kölliker used the term *Discophora* for the Scyphomedusæ alone, an illegitimate limitation of the term which was followed by Louis Agassiz in 1860. Nicholson has used the term in a reverse sense for a heterogeneous assemblage of those medusæ not classified by Huxley as Lucernaridæ, nor yet recognized as derived from hydroid trophosomes. This use of the term adds to the existing confusion, and renders its abandonment necessary. . . . The term *Discophora* is used by Claus for the Discomedusæ. *Encyc. Brit.*, XII. 556.

2. An order of suctorial worms, the leeches: so called from their sucking-disks. See *Hirudinea*.

G. *disconto* = Dan. *diskonto* = Sw. *diskont*), < ML. *discomputus*, discount; from the verb: see *discount*, *v.*] **1.** An allowance or deduction, generally of so much per cent., made for prepayment or for prompt payment of a bill or account; a sum deducted, in consideration of cash payment, from the price of a thing usually sold on credit; any deduction from the customary price, or from a sum due or to be due at a future time. —**2.** In *finance*, the rate per cent. deducted from the face value of a promissory note, bill of exchange, etc., when purchasing the privilege of collecting its amount at maturity. *Bank discount* is simple interest paid in advance, and reckoned, not on the sum advanced in the purchase, but on the amount of the note or bill. This is the method recognized in business and in law. *True discount* is a technical term for the sum which would, if invested at the same rate, amount to the interest on the face value of the note or bill when due: thus, $5 is the bank discount at the rate of 5 per cent. on a bill drawn at twelve months for $100; while $4.7619 is the true discount, because that sum if invested at 5 per cent. would at the end of a year amount to $5. True discount may be found by multiplying the amount of a bill or note by the rate of discount and dividing by 100 increased by the rate; while bank discount is computed in the same manner as simple interest.

3. The act of discounting: as, a note is lodged in the bank for *discount*; the banks have suspended *discounts*. —**4.** In *billiards*, an allowance made by a superior to an inferior player of a deduction of one count from his string for every count made by the latter. A *double discount* deducts two counts for one; *three discounts*, three; and so on up to the *grand discount*, which deprives the player who discounts his opponent (gives the odds) of all prior counts whenever the latter makes a successful shot. —**At a discount**, below par; hence, in low esteem; in disfavor.

Discourse indicates the operation of comparison, the running backwards and forwards between the characters and notes of objects; this term may, therefore, be properly applied to the elaborative faculty in general. The terms *discourse* and discursus are, however, often, nay generally, used for the reasoning process, strictly considered. *Sir W. Hamilton.*

Also called *periencephalitis, mania gravis*, and *typhomania*. — **Bright's disease**, a disease, or group of diseases, first described in 1827 by Richard Bright, an English physician (1789–1858). dismal (diz'mal), *a.* and *n.* [Early mod. E. also *dismall, diesmall, dismold, dysmel, dysemol*; < ME. *dismal, dismall, dismale, disemal, dysmall*, found first as a noun in the phrase "in the *dismal*" (see quot. under II., 1), of which the orig. meaning is not certain, but which prob. stands for "in the *dismal* days or time," the word being most frequent in the phrase *dismal day* or *dismal days* (see quots. under I.). The origin and meaning of the word have been much debated. It was certainly borrowed, and prob. from the OF. From its lack of a recognized literal meaning in E., it must have been borrowed in a figurative sense. "It is just possible that the original sense of *in the dismal* [*days* or *time*] was *in tithing time*; with reference to the cruel extortion practiced by feudal lords, who exacted *tenths* from their vassals even more peremptorily than tithes were demanded for the church." (Skeat.) This view, which is prob. correct, is based upon what appears to be phonetically the only possible origin of ME. *dismal*, namely, < OF. **dismal*, F. **dimal* (vernacular form of *decimal*, F. *décimal*) = Sp. *diezmal* = Pg. *dizimal*, Sp. Pg. also *decimal* = E. *decimal*, < ML. *decimalis*, of a tenth, of tithes, < L. *decimus*, tenth, ML. fem. *decima*, a tenth, a tithe, > OF. *disme*, F. *dîme*, ME. *disme*, E. *dime*, a tithe, tenth: see *decimal* and *dime*. The notion of official extortion appears further in the related OF. *dismer, diesmer*, decimate, exact tithes, hence despoil (= Sp. *diezmar* = Pg. *dizimar*, pay tithes, decimate: see *decimate*), and in *escheat, cheat*[1], q. v.] **I.** *a.* Gloomy; dreary; cheerless; melancholy; doleful; dolorous: originally, as an adjective, in the phrase *dismal day* or *dismal days* (see etymology), whence it was extended to any visible physical surroundings, or anything perceived or apprehended, tending to depress or chill the spirits.

3. In *optics*, the separation of the different colored rays in refraction, arising from their different wave-lengths. The point of dispersion is the point where refracted rays begin to diverge. When a ray of sunlight is made to pass through prisms of different substances, but of such angles as to produce the same mean deviation of the ray, it is found that the spectra formed are of different lengths. Thus, the spectrum formed by a prism of oil of cassia is found to be two or three times longer than one formed by a glass prism; the oil of cassia is therefore said to disperse the rays of light more than the glass, or to have a greater dispersive power. It is also found that in spectra formed by prisms of different substances the colored spaces have to one another ratios differing from the ratios of the lengths of the spectra which they compose; and this property has been called the *irrationality of dispersion* or of the colored spaces in the spectrum. See *prism* and *refraction*.

Dispersion has been accounted for by the different speeds of light of different wave-lengths in the same refracting medium. *Tait*, Light, § 72.

In consequence of . . . *dispersion* of the colours in various directions of vibration, white light becomes broken up in a mode which is comparable with the *dispersion* of colour by ordinary refraction, and on this account has received the name of circular or rotary *dispersion*.

It may be *crossed, horizontal*, or *inclined*. It is *crossed* when the acute bisectrix coincides with the orthodiagonal axis. When a section of a biaxial crystal cut normal to the acute bisectrix is viewed in converging polarized light, the dispersion of the optic axes or bisectrices is generally marked by the arrangement of the colors in the interference-figures seen. It is *horizontal* when the obtuse bisectrix coincides with the orthodiagonal axis; and *inclined*, in monoclinic crystals, when the optic axes lie in the plane of symmetry.—**Dispersion of the optic axes,** in *crystal.*, the separation of the axes for different colors in biaxial crystals, which takes place when the axial angles have different values; it is usually described as $\rho > v$, or $\rho < v$, according as the angle for red rays is greater or less than that for blue rays.—**Epipolic dispersion.** See *epipolic*.—**The dispersion,** the Jews dispersed among the Gentiles during and after the Babylonian captivity; the diaspora: most frequently used of the scattered communities of Jews referred to in the New Testament, either of such communities collectively and in general, or of the communities in some single country or group of countries: as, *the* Parthian *dispersion; the dispersion* of Asia Minor; *the* Egyptian *dispersion; the dispersion* in Rome. By both helices and magnets Faraday caused the plane of polarisation in perfectly neutral liquids and solids to rotate. If the turning of the plane of polarisation be a demonstration of molecular *dissymmetry*, then, in the twinkling of an eye, Faraday was able to displace symmetry by *dissymmetry*, and to confer upon bodies, which in their ordinary state were inert and dead, this power of rotation which M. Pasteur considers to be the exclusive attribute of life. *Tyndall*, Int. to Life of Pasteur, p. 17.

The lower end of the distaff was held between the left arm and the side, and the thread, passing through and gaged by the fingers of the left hand, was drawn out and twisted by those of the right, and wound on a suspended spindle made so as to be revolved like a top, which completed the twist. In Eastern countries and in some districts of Europe, especially in Italy, the primitive distaff and spindle are still used; but after the introduction of the spinning-wheel into Europe, about the fifteenth century, the distaff became an attachment only of that designed for flax, and thus continued in general use till a recent period, modified in form.

distemper[2] (dis-tem'pėr), *n.* [Also written *destemper*; = F. *détrempe*, distemper, water-colors, a painting in water-colors; from the verb.] **1.** A method of painting in which the colors are mixed with any binding medium soluble in water, such as yolk of egg and an equal quantity of water, yolk and white of egg beaten together and mixed with an equal quantity of milk, fig-tree sap, vinegar, wine, ox-gall, etc. Strictly speaking, distemper painting is painting in water-color with a vehicle of which yolk of egg is the chief ingredient, upon a surface usually of wood or canvas, covered with a ground of chalk or plaster mixed with gum, this ground itself being frequently called *distemper*. See *distemper-ground*. If the glutinous medium is present in too great quantity, the colors will scale off when the painting is exposed to the air, so that they should be applied in thin layers and not be retouched until they are perfectly dry.

This mode of painting [tempera], which is undoubtedly the most ancient, and which, in trade purposes, is called *distemper* painting, derives its name from the fact that the colours are "tempered" or mixed with some liquid or medium to bind their separate particles to each other and to the surface to which the paint is to be applied.

2. The volatilization and subsequent condensation of a liquid by means of an alembic, a still and refrigeratory, or a retort and receiver; the operation of obtaining the spirit, essence, or essential oil of a substance by the evaporation and condensation of the liquid in which it has been macerated; rectification; in the widest sense, the whole process of extracting the essential principle of a substance. The most common method of conducting the process of distillation consists in placing the liquid to be distilled in a boiler of copper or other suitable material, called the *still*, having a movable head from which proceeds a coiled tube called the *worm*, which passes through water constantly kept cold. Heat being applied to the still, the liquid in it is volatilized, and rises in vapor into the head of the still, whence, passing down the curved tube or worm, it becomes condensed by the cold water, and makes its exit in a liquid state. The object of distillation is to separate volatile liquids from non-volatile liquids and solid matters, and also, by the operation called *fractional distillation* (which see, below), to separate from each other volatile liquids which have different boiling-points. The process is used in the arts, in the manufacture of alcohol and spirituous liquors, for preparing essences and essential oils, and for a great variety of other purposes.

The mixture is distilled in an apparatus which admits of constant observation of the temperature, and the liquids obtained between certain intervals of temperature (five or ten degrees) are collected separately. The more volatile liquid will be found chiefly in the "fractions" first collected; and by repeating the process with the first fraction, this more volatile liquid may be obtained in a state of comparative or absolute purity.

4. Very plain and intelligible in thought or expression. The distinction made by writers on vision between imperfection of vision due to want of light (obscurity) and that owing to distance (confusion) was transferred to psychology by Descartes. With him a *distinct* idea is one which resists dialectic criticism. Later writers, adhering more closely to the optical metaphor, make a *clear* idea to be one distinguishable from others, and a *distinct* idea to be one whose parts can be distinguished from one another; hence, one which can be abstractly defined.

Petrus Hispanus says, "*Distribution* is a multiplication of a common term made by a universal sign; thus, when we say *every man*, the latter term is distributed or confounded by the sign *every*, so that there is a multiplication."

He will tell you that this axiom containes a *distribution*, and that all such axioms are generall; and lastly, that a *distribution* in which any part is wanting, or abundant, is faulty and fallacious. *Milton*, On Def. of Humb. Remonst.

In some States the term is applied to a class of towns. In South Carolina, during most of the period from 1768 to 1868, the chief subdivision of the State (excepting the coast region) was called a *district*, instead of a county as in the other States. In the Methodist Episcopal Church the district is a territorial subdivision of a conference, comprising a number of churches and societies, under the charge of a presiding elder. A *military district* of a country is a division of a military territorial department. The federal territory containing the national capital is called the *District of Columbia.* Abbreviated *dist.*

Its simpler and more majestic form, as composed by Lasos, Simonides, Bacchylides, and Pindar, assumed in the latter part of the fifth century a complexity of rhythmical and musical form and of verbal expression which degenerated in the fourth century into a mimetic performance rendered by a single artist. From these different stages in its history the word *dithyramb* has been used in later ages both for a nobly enthusiastic and elevated and for a wild or inflated composition. There are three leading species: the great northern diver, *Colymbus torquatus*; the black-throated diver, *C. arcticus*; and the red-throated diver, *C. septentrionalis*. All three inhabit the northern hemisphere generally, and are noted not only for their quickness in diving, but also for the length of time they remain and the distance they traverse under water, in which they move both by swimming with the feet and by paddling with the wings. See *loon*. Also *diving-bird*.

2. One who plunges into or engages deeply in anything.—**Cartesian diver.** See *Cartesian*.

diver[2]†, *n.* See *dyvour*.

Hence—**2.** In general, to become or be separated from another, or one from another; take different courses or directions: as, *diverging* trains of thought; lives that *diverge* one from the other.

And wider yet in thought and deed

3. To differ from a typical form; vary from a normal state or from the truth.—**4.** In *math.*, to become larger (in modulus) without limit: said of an infinite series when, on adding the terms, beginning with the first, the sum increases indefinitely toward infinity. Double images in sleepiness are certainly due to *divergence*, not convergence, of the optic axes.
Le Conte, Sight, p. 253.

3. In *math.*, the negative of the scalar part of the result of operating with the Hamiltonian operator upon a vector function. Concave lenses render parallel rays divergent, convex lenses convergent.—**Divergent series**, an infinite series such that, if we begin adding the terms together in their order, we do not ultimately approximate indefinitely toward a finite limit, but either oscillate from one value to another or move toward infinity. Only in the latter case, according to the usage of mathematicians, is a divergent series said to diverge. Thus, for instance, the infinite series $1-1+1-1+1-1+1$ is *divergent* without diverging.—**Divergent strabismus.** See *strabismus*.—**Divergent wings**, in *entom.*, wings which in repose are horizontal but spread apart, receding from the abdomen, as in many flies.

It. *diverso*, < L. *diversus*, various, different, also written *divorsus*, pp. of *divertere*, *divortere*, turn or go different ways, part, separate, divert: see *divert*. According to modern analogies, the word *divers* would be written *diverse* (pron. dī'vėrs); association with the F. original favored the spelling *divers*; and this form, with the plurality involved in the word, caused it to be regarded as a plural (whence the pron. dī'vėrz). Hence in mod. speech *divers* is used only with a plural noun. It is now obsolete or archaic, the form *diverse*, regarded as directly from the L., having taken its place. In earlier use *divers* and *diverse* are merely different spellings of the same word; early quotations are therefore here all put under *divers*. See *diverse*.] **1†.** Different in kind, quality, or manner; various.

The *divineress* ought to have no perturbations of mind, or impure passions, at the time when she was to consult the oracle; and if she had, she was no more fit to be inspired than an instrument untuned to render an harmonious sound. *Dryden*, Plutarch.

diving-beetle (di′ving-bē′tl), *n.* A popular name for various aquatic beetles of the family *Dytiscidæ*. They swim freely in the water, and may often be seen diving rapidly to the bottom, whence their name. See cut under *Dytiscus*.

diving-bell (di′ving-bel), *n.* A mechanical contrivance consisting essentially of an inverted cup-shaped or bell-shaped chamber filled with air, in which persons are lowered beneath the surface of the water to perform various operations, such as examining the foundations of bridges, blasting rocks, recovering treasure from sunken vessels, etc. Diving-bells have been made of various forms, such as that of a bell, or a hollow truncated cone or pyramid, with the smaller end closed and the larger one, which is placed lowermost, open. The air contained within the bell prevents it from being filled with water on submersion, so that the diver may descend in it and breathe freely, provided he is furnished with a new supply of fresh air as fast as the contained air becomes vitiated by respiration. The diving-bell is now generally made of cast-iron in the form of an oblong chest (A), open at the bottom, and with several strong convex lenses set in its upper side or roof, to admit light to the interior. It is suspended by chains from a barge or other suitable vessel, and can be raised or lowered at pleasure, in accordance with signals given by the persons within, who are supplied with fresh air injected into a flexible pipe by means of a forcing-pump (B) placed in the vessel, while the vitiated air escapes by a cock in the upper part of the bell. An improvement on this form, called the *nautilus*, enables the occupant, instead of depending upon the attendants above, as in the older forms, to raise or sink the bell, move it about at pleasure, or raise great weights with it and deposit them in any desired spot.

Diving-bell.

diving-spider (di′ving-spī′dėr), *n.* An aquatic spider, *Argyroneta aquatica*, which builds its nest under water, and habitually dives to reach it, carrying down bubbles of air, with which it fills its nest on the principle of the diving-bell. It is thus enabled to remain under water, though fitted only for breathing air. See cut under *Argyroneta*.

diving-stone (di′ving-stōn), *n.* A name given to a species of jasper.

divining-rod (di-vī′ning-rod), *n.* A rod or twig used in divining; especially, a twig, generally of hazel, held in the hand and supposed by its bending downward to indicate spots where metalliferous deposits or water may be found by digging. It is usually made of two twigs of hazel, or of apple or some other fruit-tree, tied together at the top with thread, or of a naturally forked branch, and is grasped by both hands in such a way that it moves when attracted by the sought-for deposit. This method of searching for ore or water has been in use for centuries, but its efficacy is now rarely credited by intelligent persons.

Shall we have most likelihood of success if we dig from east to west, or from west to east?—or will you assist us . . . with your *divining-rod* of witches-hazel?

The capacity of being divided or separated into parts. —2. In *arith.*, the capacity of being exactly divided—that is, divided without remainder.—**Infinite divisibility**, the character of being divisible into parts which are also divisible, and so on ad infinitum. As applied to matter, the term implies properly that any portion of matter may, by the exercise of sufficient force, be separated into parts. After the general acceptance of the Daltonian theory of atoms, the term *infinite divisibility of matter* was long retained with the meaning of the infinite divisibility of space.

The geometricians (you know) teach the *divisibility* of quantity *in infinitum*, or without stop, to be mathematically demonstrable. *Boyle*, Things above Reason.

I said at first that *infinite divisibility of matter* was the doctrine now in vogue amongst the learned, but upon second thoughts I believe I have misrepresented them, and the mistake arose from want of distinguishing between *infinite* and indefinite *divisibility*.
A. Tucker, Light of Nature, III. iii. § 12.

Dan. Sw. *division*, < L. *divisio(n-)*, division, < *dividere*, pp. *divisus*, divide: see *divide*.] 1. The act of dividing or separating into parts, portions, or shares: as, the *division* of a word (as by means of a hyphen at the end of a line); the *division* of labor; the *division* of profits.

I'll make *division* of my present with you:
Hold, there is half my coffer. *Shak.*, T. N., iii. 4.

Specifically—(*a*) [L. *divisio(n-)*, tr. of Gr. διαίρεσις.] In *logic*, the enumeration and naming of the parts of a whole; especially, the enumeration of the species of a genus. The latter is also distinguished as *logical division*. *Division* is mainly distinguished from *classification* in that the latter is a modern word, and supposes minute observation of the facts, while the former, as an Aristotelian term, denotes a much ruder proceeding, based on ordinary knowledge, and undertaken at the outset of the study of the genus divided. One of the distinctive doctrines of the Ramist school of logicians was that all division should proceed by dichotomy.

Division is a dividyng of that whiche is more commune into those whiche are lesse commune. As a definicion therefore dooeth declare what a thing is, so the *division* sheweth how many thinges are conteined in the same.
Sir T. Wilson, Rule of Reason (1551).

Division is the parting or dividing of a word or thing that is more generall, unto other words or things lesse generall. *Blundeville*, Arte of Logicke (1599), ii. 3.

(*b*) In *her.*, the separating of the field by lines in the direction of the bend, the bar, etc. (called *division bendwise*,

barrise, etc.), also for the purpose of impaling two shields together, or in quartering. (*c*) The separation of members in a legislative house in order to ascertain the vote. This is effected in the British House of Commons by the passing of the affirmative and negative sides into separate lobbies, to be counted by tellers; in American legislatures, by their rising alternately, or, as is frequently done in the House of Representatives, by passing between tellers standing in front of the Speaker's desk. In the British House of Commons the usual method of voting on any contested measure is by division; in the United States, by ayes and noes, or affirmative and negative answers on a call of the roll.

> The motion passed without a *division*. *Macaulay.*

2. In *math.*: (*a*) The operation inverse to multiplication; the finding of a quantity, the quotient, which, multiplied by a given quantity, the divisor, gives another given quantity, the dividend. In elementary arithmetic division is often defined as, for example, "the partition of a greater summe by a lesser" (*Recorde*, 1540); but such a definition applies only when the quotient is an abstract number and an integer. Division is denoted by various signs. Thus, *a* divided by *b* may be written in any of the following ways:

$$a \div b, \quad \frac{a}{b}, \quad a/b, \quad a:b, \quad ab^{-1}.$$

Where multiplication is not commutative (that is, where xy is not generally equal to yx) there are two kinds of division; for if $xy = z$, x may be regarded as the quotient of z divided by y, or y as the quotient of z divided by x. These two kinds of division are denoted as follows:

$$xy \div y = x, \quad \frac{xy}{x} = y, \quad xy/y = x, \quad xy:y = x, \quad x^{-1}(xy) = y.$$

Division is one of the fundamental operations in arithmetic, common algebra, and quaternions; but in other forms of algebra it generally gives an indeterminate quotient, and so loses its importance. (*b*) A rule or method for ascertaining the quotient of a divisor into a dividend: as, long *division*. (*c*) A section; the separation of a geometrical figure into two parts.—**3.** The state of being divided; separation of parts: as, an army weakened by *division*; *divisions* among Christians.

> Hate is of all things the mightiest divider; nay, is *division* itself. *Milton*, Divorce, ii. 21.

4. That which divides or separates; a dividing line, partition, or mark of separation; any sign or cause of separation or distinction.

5. A part separated or distinguished in any way from the rest; a minor part or aggregate; a distinct portion: as, the *divisions* of an orange; a *division* of mankind or of a country; the *divisions* of a book or of a discourse.

> Express the heads of your *divisions* in as few and clear words as you can. *Swift.*

Specifically—(*a*) A definite part of an army or of a fleet, consisting of a certain number of brigades or of vessels under a single commander.

> For his *divisions*, as the times do brawl,
> Are in three heads; one power against the French,
> And one against Glendower; perforce, a third
> Must take up us. *Shak.*, 2 Hen. IV., i. 3.

(*b*) A part of a ship's company set apart for a certain service in action. Those who serve at the guns are classed as the *first*, *second*, *third*, and *fourth divisions*; the *powder division* provide the guns with ammunition; the *master's division* steer the ship and work the sails; and the *engineer's division* manage the engines and the boilers. (*c*) A geographical military command, consisting of two or more departments. Thus, the Military *Division* of the Missouri consisted of the department of Dakota, the department of the Platte, the department of the Missouri, and the department of Texas. The United States is divided for military purposes at the present time (1899) into eight departments (see *department*), the system of divisions having been discontinued. (*d*) In *nat. hist.*: (1) In zoölogical classification, any group of species forming a part of a larger group: in entomology, sometimes specifically applied to a group smaller than a suborder and larger than a family, as the division *Gymnocerata* of the *Heteroptera*. A *section* may be equivalent in value to a division, or a group subordinate to it; a *series* is a division in which the minor groups show a regular gradation in structure. (2) In botanical classification, one of the higher grades in the sequence of groups, equivalent to *subkingdom* or *series*, as the phænogamous and cryptogamous *divisions* of plants. It is also often used as subordinate to *class*, as the polypetalous, apetalous, etc., *divisions* of dicotyledonous plants. By some authors it has been used to designate a grade between *tribe* and *order*.

6. The state of being divided in sentiment or interest; disunion; discord; variance; difference.

> Are they not sign and symbol of thy *division* from Him?
> *Tennyson*, The Higher Pantheism.

7. In *music*, a rapid and florid melodic passage or phrase, usually intended to be sung at one breath to a single syllable: so called because originally conceived as the elaboration of a phrase of long tones by the division of each into several short ones. It was common in the music of the eighteenth century.

> Sweet as ditties highly penn'd,
> Sung by a fair queen in a summer's bower,
> With ravishing *division*, to her lute.
> *Shak.*, 1 Hen. IV., iii. 1.
>
> Music, advance thee on thy golden wing,
> And dance *division* from sweet string to string.
> *Middleton*, Blurt, Master-Constable, i. 1.

8. The precise statement of the points at issue in any dispute. [Rare.]

> The *devision* is an openyng of thynges wherein we agree and rest upon, and wherein we stick and stand in travers, shewing what we have to saie in our owne behalfe.
> *Sir T. Wilson*, Rhetoric (1553).

Accidental division, a division of a subject according to its accidents: as, good things are, according to Aristotle, either qualities of mind, qualities of body, or accidents of fortune.—**Centesimal division.** See *centesimal*.—**Complementary division**, a method of division given by Boëthius. The smallest round number larger than the divisor is used, and also the complement of the divisor, or the remainder after subtracting it from the round number. The first figure of the quotient is set down, from the dividend is subtracted the product of this by the round number, and to the remainder is added the product of the same figure of the quotient by the complement of the divisor. The sum is treated as a new dividend.—**Complex** or **compound division**, the division of a complex or compound number either by a number of the same sort or by an abstract number, as the division of 3 days 13 hours 17 minutes by 1 day 18 hours 28 minutes 36 seconds, or by 7.—**Direct division.** (*a*) Division not complementary. (*b*) A rule for dividing one number by another, so as to obtain the entire period of the circulating decimal of the quotient. Both dividend and divisor are multiplied by the same number so as to make the last significant figure of the divisor 9. By striking off from the divisor so multiplied the 9, together with any ciphers which may follow it, and increasing the truncated remnant by 1, a number is obtained called the current multiplier. The last figure of the multiplied dividend is now struck off, multiplied by the current multiplier, and the product added to the truncated dividend. The sum is treated as a new dividend; and this process is continued until the dividends begin to repeat themselves. The successive figures struck off from the dividend from last to first are now written down from left to right as a whole number, and subtracted from the circulating part of the same figures repeated indefinitely into the decimal places. The remainder, after shifting the decimal point as many places to the left as there were zeros struck off from the divisor along with the 9, is the quotient sought.—**Division by circulating decimals**, a method of dividing by means of a table of circulating decimals.—**Division by factors**, the process of dividing successively by factors of the divisor.—**Division by logarithms**, a method of dividing based on the fact that the logarithm of the quotient is the logarithm of the dividend diminished by the logarithm of the divisor.—**Division of a ratio**, the reduction of a proportion from $a:b = c:d$ to $b - a:a = d - c:c$.—**Division of labor**, in *polit. econ.*, the dividing up of a process or an employment into particular parts, so that each person employed can devote himself wholly to one section of the process.—**Division of the question**, in a legislative body, the division of a complex proposition or motion into distinct propositions, in order that each may be considered and voted upon separately: a course resorted to, upon motion or demand, when any of the members favor parts but not the whole of the measure. The presiding officer usually has the power of deciding whether such division is admissible.—**Division viol.** See *viol*.—**General of division.** See *general*, *n.*—**Golden division**†, arithmetical division not complementary.—**Harmonic division of a line.** See *harmonic*.—**Iron division**†. Same as *complementary division*.—**Logical division**, any division not a partition, being either a nominal, substantial, or accidental division.—**Long division**, the common modern method of arithmetical division when the divisor is a number larger than 10. The greatest number of times that the divisor is contained in the first figures of the dividend, beginning with the left (a sufficient number being taken to make a number greater than the divisor), is set down to the right of the dividend, as the first figure of the quotient; the divisor is then multiplied by this quotient, and the product is subtracted from the left-hand part of the dividend; to the remainder the next figure to the right in the dividend is then annexed, and the number thus formed is treated as a new dividend; and so on. The same method is extended in algebra to the division of polynomials in general. The rule is of Italian origin. See *scratch division*.—**Nominal division**, an enumeration of the different senses of an equivocal word or expression; a distinction.—**Partible division**, the mental division of a whole into its parts, as of the English nation into sovereign, lords, and commons; partition.—**Real division**, a division relating to facts, not a mere distinction between different meanings of a word, embracing substantial, partible, and accidental division; the explication of a whole by its parts.—**Scratch division**, the ordinary method of division before long division came into general use, late in the seventeenth century. The products were not set down at all, but only the remainders. The divisor was set down under the dividend; the first figure of the quotient was then set down and was multiplied by the first figure of the divisor, and the remainder was set down over the corresponding figures of the dividend, which were immediately canceled, together with the first figure of the divisor. This process having been repeated until the whole divisor had been canceled, the latter was written down again one place further to the left, the second figure of the quotient was set down, and the whole proceeding repeated until a remainder was obtained less than the divisor. The following shows the successive stages of the division of 351 by 13:

```
                          2   2
      1   19  19  19  19  19  19
351 ( 351 (2 351 (2 351 (2 351 (27 351 (27
13    13    13    133   133   133
                  1     1     1
```

The rule was derived from Arabian writers.—**Short division**, a process of division practised with a divisor not larger than 10, in which the quotient is set down directly, being written from left to right, usually below a line under the dividend, without auxiliary figures.—**Substantial division**, or **division per se**, the division of a genus into its species.—**To run division**†, in *music*, to make florid variations on a theme.

About 1670 it replaced the Aretinian *ut*, which is still somewhat used in France. In the tonic sol-fa system it is spelled *doh*, and indicated by its initial *d;* its significance is limited to the first tone of the scale, without reference to the keyboard. In teaching sight-singing by the help of solmization, two general methods are in use: (*a*) the *fixed-do* method, in which *do* is always applied to tones bearing the letter-name C, whether they are key-notes or not; and (*b*) the *movable-do* method, in which *do* is always applied to the key-note, whatever be its letter-name. dock[3] (dok), *n.* [< MD. *docke* = D. *dok* = Flem. *dok*, a dock; cf. (from the E. or D.) Sw. *docka* = Dan. *dok*, *dokke* = G. *dock*, *docke* = F. *dock*, a dock. Origin unknown; cf. OFlem. *docke*, a cage (see *dock*[4]); Icel. *dökk*, *dökdh*, a pit, pool, = Norw. *dokk*, *dekk*, *dekt*, a hollow, low ground surrounded by hills. The word is by some connected with It. *doccia*, a canal, conduit, pipe, formerly also "a damme of a mill" (Florio), ult. < L. *ducere*, lead (see *douche*, *duct*), or with ML. *doga*, a ditch, canal, also a vessel, cup, perhaps < Gr. δοχή, a receptacle, < δέχεσθαι, receive.] In *hydraulic engin.*, strictly, an inclosed water-space in which a ship floats while being loaded or unloaded, as the space between two wharves or piers; by extension, any space or structure in or upon which a ship may be berthed or held for loading, unloading, repairing, or safe-keeping. The water-space may communicate freely with the stream or harbor, or the entrance to it may be closed by a gate or by a lock. If provided with a lock or gate, the level of the water within the dock remains at all times nearly the same, as the gate is opened only at full tide, when the level without and within is the same. If a lock is employed, vessels can pass in and out at all stages of the tide, but this does not materially affect the level of the water inside the dock. In an open dock the tide continually lowers or raises the vessel, and this interferes in some degree with the work of loading or unloading. The closed docks are free from this inconvenience, while a greater advantage is found in the absence of currents. In a larger sense the term is also applied to a basin or inclosed water-space for the storage of floating timber or the safe-keeping of river-steamers, barges, or canal-boats laid up for the winter, and by a further extension is made to include the wharves and warehouses on or in the neighborhood of a dock. The largest closed docks are at Liverpool and London, in England. In a particular sense the term is also applied to the construction and apparatus used in repairing and building ships, as the *floating dock*, *dry-dock*, *depositing-dock*, and *sectional dock*.

The saide shippe, called the Holy Crosse, was so shaken in this voyage, and so weakened, that she was layd vp in the *docke*, and neuer made a voyage after.
Hakluyt's Voyages, II. i. 98.

Depositing-dock, a caisson or an elevator for lifting vessels from the water and placing them upon stagings or wharves erected for the purpose. The lifting apparatus consists of a series of caissons or pontoons, placed side by side and joined at one end to another pontoon that, with a series of upright tubular structures, forms a girder and makes the back of a comb-like structure, of which the pontoons are the teeth. In the rear of the girder is a large floating pontoon, connected with it by two rows of heavy booms that, being pivoted at each end, serve as a series of parallel bars and keep the entire structure upright while afloat. To lift a vessel, a row of blocks with shores and chocks is arranged on top of all the pontoons. The air is allowed to escape, and the entire structure, except the float in the rear, sinks till the vessel can be floated over the pontoons. When the vessel is in position the water is pumped out of the pontoons, and they all rise together, lifting the vessel out of the water.—**Dry-dock**, a dock or an excavated basin adjoining navigable water, provided with a gate, and so arranged that, after the docking of a ship, the water can be exhausted from it. Such docks are long and narrow, with sloping sides formed in steps. The modern method of construction is to excavate the basin in the shore, and to drive heavy piling along the bottom and upon the sloping sides and rear end. Upon the piles are laid heavy timbers to form the floor and the steps at the sides. At the entrance are double gates opening outward, and meeting at an angle when closed, to resist the pressure of the water on the outside when the dock is empty. A recent method of closing a dry-dock is by means of a floating gate or caisson with flat bottom and wide stem and stern, which is floated into position across the entrance and loaded with water-ballast till it sinks, fitting tightly by a keel into a groove in the gateway. To use the dock, the gate is opened, or floated away at high water, and the ship is drawn into the dock and held afloat over a line of blocks along the center of the dock. The gate is then put in position, and sunk till the dock is closed water-tight. The water within the dock is then exhausted by steam-pumps, leaving the ship supported on the blocks, and braced on both sides by shores extending to the dock-steps. A typical dry-dock is the Brooklyn Navy-yard Dock No. 1, which is 500 feet long, 60 feet wide at the bottom, and capable of admitting a ship drawing 18 feet. Steam-pumps with a capacity of 40,000 gallons of water a minute are used to empty it.—**Floating dock**, a capacious wooden or iron structure, generally rectangular, intended to serve as a graving-dock. Sometimes floating docks are built in water-tight compartments, and can be sunk to the required

depth by the admission of water into these compartments. When the vessel is docked, the floating dock is raised by pumping, till its bottom touches the keel of the ship. Shores are then added to keep the ship in position, and the dock is raised higher. Instead of compartments, water-tight tanks are occasionally used, and the dock is raised and

lowered on the same principle. A floating dock may also be made so heavy as to sink by its own weight deep enough to receive the largest vessel, and be raised by means of empty water-tight tanks, which lift dock and ship by their buoyancy.—**Graving-dock**, a dry-dock: so called because used in graving or cleaning the bottom of ships. The graving-docks in the navy-yards of Brooklyn, Boston, and Norfolk are important examples.—**Half-tide dock**, a basin connecting two or more docks, and communicating with the entrance-basin.—**Sectional dock**, a floating dock composed of a succession of pontoons or caissons attached to a platform below the vessel. Steam-pumps are used to remove the water from the caissons, and, as they float, the vessel is raised.

It received its name from statements contained in President Monroe's annual message to Congress in December, 1823, at the period of a suspected concert of the powers in the Holy Alliance to interfere in Spanish America in behalf of Spain. The following are the most significant passages in the message: "We could not view an interposition for oppressing them [the Spanish-American republics] or controlling in any other manner their destiny by any European power, in any other light than as a manifestation of an unfriendly disposition toward the United States." "The American continents should no longer be subjects for any new European colonial settlement."

The only thing which the *Monroe Doctrine* really contains is the intimation on the part of the United States of a right to resist attempts of European Powers to alter the constitutions of American communities.
G. P. Fisher, Outlines of Universal Hist., p. 602.

=**Syn. 1.** *Precept, Doctrine, Dogma, Tenet.* *Precept* is a rule of conduct, generally of some exactness, laid down by some competent or authoritative person, and to be obeyed; it differs from the others in not being especially a matter of belief. (See *principle.*) *Doctrine* is the only other of these words referring to conduct, and in that meaning it is biblical and obsolescent. In the Bible it refers equally to teaching as to the abstract truths and as to the duties of religion: "In vain they do worship me, teaching for *doctrines* the commandments of men." (Mat. xv. 9.) As distinguished from *dogma* and *tenet*, *doctrine* is a thing taught by an individual, a school, a sect, etc., while a *dogma* is a specific doctrine formulated as the position of some school, sect, etc., and pressed for acceptance as important or essential. *Dogma* is falling into disrepute as the word for an opinion which one is expected to accept on pure authority and without investigation. *Tenet* is a belief viewed as held, a doctrinal position taken and defended. It is equally applicable to the beliefs of an individual and of a number; it has no unfavorable sense.

faces of an ordinary icosahedron. It has 12 faces, 12 vertices, 30 edges, 5 sides per face, and 5 sides per vertex. The form approximating most closely to it is the pentagonal dodecahedron, or the pyritohedron, in which the faces are five-sided, but not regular pentagons.—**Regular dodecahedron,** in *geom.*, a dodecahedron whose faces are all regular polygons, and whose vertices are all regular solid angles. It has 12 faces, 12 vertices, 30 edges, 5 edges per face, and 5 edges per vertex. The succession of faces about a vertex goes round the vertex once, the succession of vertices around a face goes round the center of the face twice, and the center of the solid is twice inclosed.—**Truncated dodecahedron,** a dyocætriacontahedron formed by cutting off the faces of the regular dodecahedron parallel to those of the coaxial icosahedron so as to leave the former decagons. It is one of the thirteen Archimedean solids.

dodo (dō′dō), *n.* [< Pg. *doudo*, a dodo, < *doudo, doido*, a simpleton, a fool, < *doudo, doido*, adj., simple, foolish. According to Diez, this word, which is unknown in Spanish, came from England (?): E. dial. (Devon) *dold*, stupid, confused: see *dolt.* Cf. *booby*, a bird so named for a similar reason. The bird was also named by the Dutch (1) *walgh-vogel*, now *walg-vogel*, lit. 'nauseous bird'; also (2) *dod-aers*, lit. 'dead-arse,' "propter fœdam posterioris partis crassitiem" (note dated 1626), or because of some resemblance to the dabchick or little grebe, which was also so called; also (3) *dronte* (> Dan. *dronte* = Sw. *dront*); origin unknown. The NL. name is *didus*, Sp. *dido*: see *Didus.*] A recently extinct bird of Mauritius, *Didus ineptus*, the type of the family *Didida* and suborder *Didi*, now usually assigned to the order *Columbæ.* The dodo was living in Mauritius on the discovery of that island by the Portuguese under Mascarenhas in the beginning of the sixteenth century, and it is known to have survived until July, 1681. Knowledge of the bird was for some time confined to the quaint and often questionable narratives of voyagers, certain pictures, mostly by Dutch artists, and a few fragmentary remains. In 1866 bones in abundance were found, and the osseous structure has been described in detail. The dodo was a massive, clumsy, flightless, and defenseless bird, about as large as a swan, covered with downy feathers, with a very stout hooked bill, short strong legs, short tail, and wings too small for flight; so that it soon succumbed under the new conditions which the occupation of the island introduced, its extinction being probably due as much to the animals which man introduced as to the human invaders of the island. The solitaire (*Pezophaps solitarius*) of Rodriguez, an island of the same group, was similar to the dodo, but sufficiently distinct to be placed in a different genus. (See *solitaire.*) The neighboring island of Réunion or Bourbon also had a dodo, in all probability a third kind.

Dodo (*Didus ineptus*).
From a painting in the Belvedere, Vienna.

You shall receue . . . a strange fowle: which I had at the Iland Mauritius called by ye Portingalls a *Do Do:* which for the rareness thereof I hope wilbe welcome to you.
Emanuel Altham, letter written in 1628.

[This is the earliest known English mention of the bird.]

The *Dodo* comes first to a description: here and in Dygarrois [Rodriguez] (and no where else, that I ever could see or heare of) is generated the *Dodo* (a Portuguize name it is, and has reference to her simpleness), a Bird which for shape and rareness might be call'd a Phœnix (wer 't in Arabia).
Sir T. Herbert, Travels (ed. 1638).

Hence in comp. *bandog, bulldog*, etc.] **1.** A quadruped of the genus *Canis, C. familiaris*. The origin of the dog is a question most difficult of solution. Some think the breed is derived from the wolf, others affirm it to be from a familiarized jackal; all agree that no trace of it is to be found in a primitive state, the dhole of India and the dingo of Australia being wild descendants from domesticated ancestors. The view now generally taken by naturalists is that the dog is neither a species, in the zoölogical sense, nor even the descendant of any one species modified by domestication, but that the dogs of different parts of the world have a correspondingly various ancestry, from different wild species of the genus *Canis*, as wolves, foxes, and jackals. This view is supported not only by the enormous differences between dogs, but also by the readiness with which nearly all dogs cross with their wild relatives; and, accordingly, the name *Canis familiaris* is a conventional rather than a proper zoölogical designation of the dog as a species. No satisfactory classification of the different kinds of dogs has been arrived at, what some naturalists regard as types being regarded by others as mere mongrels. An old classification grouped dogs in three classes, the *Celeres, Sagaces*, and *Pugnaces*. Colonel Hamilton Smith groups the domestic dog into six sections: (1) the *wolf-dogs*, including the Siberian, Eskimo, Newfoundland, Great St. Bernard, sheep-dog, etc.; (2) *watch-* and *cattle-dogs*, including the German boar-hound, Danish dog, dog of the North American Indians, etc.; (3) the *greyhounds*, as the different kinds of greyhound, Irish hound, lurcher, Egyptian street-dog, etc.; (4) the *hounds*, as the blood-hound, staghound, foxhound, harrier, beagle, pointer, setter, spaniel, springer, cocker, Blenheim dog, poodle, etc.; (5) the *curs*, including the terrier and its allies; (6) the *mastiffs*, including the different kinds of mastiff, bulldog, pug-dog, etc. All these are artificial varieties, having comparatively little stability, their distinctive characters being soon lost by reversion to a more generalized type if they are left to interbreed. This tendency to reversion requires to be constantly counteracted by "artificial selection" at the hands of breeders, in order that the several strains may be kept pure, and their peculiarities be perpetuated along the desired lines of specialization. The best-bred dogs, of whatever kind, are those furthest removed from an original or common type of structure. The differences between dogs of all kinds are vastly greater than those found among individuals of any species in a state of nature; so great that, were they not known to be artificial, the dog would represent several different genera of the family *Canidæ* in ordinary zoölogical classification. In fact, some genera, based upon actual and constant differences in the dental formula, have been named in order to signalize certain structural modifications which are found to exist, affording an example of the evolution of generic characters as well as of specific differences. These variations extend not only to size and general configuration, character of the pelage, and other outward features, but also to positive osteological and dental peculiarities, more marked probably than those of any other domesticated animals. The corresponding physiological and psychological differences are equally decided, as witnessed in the dispositions and temperaments of dogs, their comparative docility, intelligence, etc., and consequently the uses to which they are or may be put. In the matter of size alone, for example, some toy dogs are tiny enough to stand easily on one of the fore paws of a large dog. Throughout the endless varieties, however, the influence of heredity is witnessed in the readiness with which dogs interbreed with one another, and cross with wolves, foxes, and jackals, bearing fertile progeny in all cases, and the readiness with which they revert to the wild state of their several ancestors. See the names of the several breeds. See also *Canidæ* and *Canis*.

Eskimo dog, one of a breed of dogs extensively spread over the northern regions of America and of eastern Asia. It is rather heavier than the English pointer, but appears smaller on account of the shortness of its legs. It has oblique eyes, an elongated muzzle, and a bushy tail, which characteristics give it a wolfish appearance. The color is generally a deep dun, obscurely barred and patched with a darker color. It is the only beast of burden in arctic latitudes, and with a team of such dogs attached to his sledge the Eskimo can travel 60 miles a day for several successive days.—**Field-dog**, a dog used for the pursuit of game in the field. Another breed is smaller and almost entirely black. Some breeds seem to be crossed with hounds, mastiffs, etc. The Newfoundland dog is remarkable for its sagacity, patience, and good nature, and for its affection for its master. No dog excels it as a water-dog, its broad half-webbed paws making it an excellent and powerful swimmer.—**Pouched dog**, a marsupial, the thylacine dasyure of Tasmania. Various dates, from July 3d to August 15th, have been assigned for the first dog-day, and various durations, from 30 to 54 days. Pliny says they began with the heliacal rising of Procyon, which took place, he says, July 19th, N. S.; and this date has been widely accepted. But he also says the sun was then entering Leo, which rule, making the dog-days begin July 23d, has also been used. Hippocrates (450 B. C.) says they were in the hottest and most unhealthy part of summer. If the season was of Babylonian origin, it would originally probably have been in early summer. Perhaps they are now most usually reckoned from July 3d to August 11th, inclusive.

In Venice the office was established in the eighth century; the doge was chosen for life, at first by the citizens, but toward the end of the twelfth century the election was restricted to a small committee of the Great Council. The power and dignity of the doges were originally very great, but gradually became limited through the jealousy of the Venetian aristocracy. In Genoa the dignity was established in the fourteenth century; the doge was at first elected for life, but from the first part of the sixteenth century the term was restricted to two years, and the authority of the doge became more limited. The office disappeared in Venice in 1797, at the overthrow of the republic, and in Genoa in the same year, although there was a temporary restoration of it in the latter city a few years later.

dogger[2] (dog'ėr), *n.* [Sc. also *doggar:* see below. The term was introduced into English geology by Young and Bird in 1822.] A sandy and oölitic ironstone. The term *Dogger Series*, however, is generally taken to include not only the dogger proper, but the gray and yellow sands which underlie it. The Dogger Series rests upon the alum shale (Upper Lias) in Yorkshire, where *dogger* is a provincial word meaning a rounded stone, in allusion to the rounded appearance caused by atmospheric action on the large blocks into which the rock is divided by joints. The dogger is much worked for the iron ore which it contains. This name as used by Continental geologists is the equivalent of that part of the Jurassic series which corresponds to the Lower Oölite of the English geologists. It is the Brown Jura of the Germans, and is there divided into three groups, distinguished by their fossil remains. The entire series consists of many alternations of clays, marls, shales, and sandstones, frequently containing iron ore, as is the case in England.

2. The monetary unit or standard of value of the United States and Canada, containing 100 cents, and equal to about 4*s.* 1½*d.* English. In the United States it is represented in the currency by gold and silver coins and by notes; in Canada by notes only. A two-dollar gold coin is current in Newfoundland. This unit was established in the United States under the confederation of the States, by resolution of Congress, July 6th, 1787. It was represented by a silver piece, the coinage of which was authorized by the act of Congress, August 8th, 1786, by which was also established the decimal system of coinage. The coinage was not begun until two years after the law of April 2d, 1792, establishing the mint. That law provided for the coinage of "dollars or units, each to be of the value of a Spanish milled dollar," as that coin was then current, and to contain 371¼ grains of pure silver, or 416 grains of standard silver. The Spanish dollar above mentioned was that struck in Spanish America. Spanish-American dollars, and coins representing halves, quarters, eighths, and sixteenths of them (the last two known as *shillings* and *sixpences* in New York and some other States, and by other names elsewhere), were abundant in the United States during the latter part of the eighteenth and the first half of the nineteenth century. The Spanish dollar coined in Spain was rare, but the intrinsic value of the two coins was the same. By an act of January 18th,

Dollar of the United States, 1795
(Size of the original.)

1837, the dollar was made to consist of 412½ grains ⅑ fine, the quantity of pure silver remaining the same, 371¼ grains. This dollar, being worth in market value from 100 to 104 cents, went out of circulation. An act of March 3d, 1849, directed the coinage of gold dollars of 25.8 grains ⅑ fine, 23.22 being pure gold; and by act of February 12th, 1873, this was declared the unit of value of the United States. The coinage of gold dollars was suspended by the act of September 26th, 1890. An act of February 28th, 1878, directed the Secretary of the Treasury to purchase silver bullion, not less than $2,000,000 nor more than $4,000,000 per month, and cause it to be coined into standard silver dollars. This was repealed by the (Sherman) act of July 14th, 1890, which provided for the purchase of 4,500,000 ounces of silver each month and the coinage of 2,000,000 ounces a month. This act was repealed in 1893. The coins representing fractional parts of the dollar are: in silver, the half-dollar and quarter-dollar, or 50-cent and 25-cent pieces, and the dime or 10-cent piece; in nickel, the half-dime or 5-cent piece (originally in silver, and inconveniently small); and in bronze, the cent (originally in copper, and much larger) and the 2-cent piece. There is also a 3-cent piece, originally coined in silver and afterward in nickel, which has been little used owing to its inconvenient smallness in both forms. By the term *dollar* in the United States notes is intended the coined dollar of the United States, a certain quantity in weight and fineness of gold or silver, authenticated as such by the stamp of the government. Sometimes abbreviated *dol.*, but commonly represented by the symbol $ (the dollar-mark) before the number. See *coinage ratio*, under *coinage*.

The Almighty *Dollar*, that great object of universal devotion throughout our land, seems to have no genuine devotees in these peculiar villages.
Irving, The Creole Village.

The Congress of 1792 fixed the monetary unit of the United States in coin, gave it the name *Dollar*, made it the unit of the money of account in their offices and courts, [and] named also its multiples and fractions.

W. *tolfaen*, an omen-stone (*faen* in comp. for *maen*, a stone).] A structure consisting of one large unhewn stone restingontwo or more unhewn stones placed erect in the earth: a term also frequently used as synonymous with *cromlech*. The name is sometimes given also to structures where several blocks are raised upon pillars so as to form a sort of gallery. The most remarkable monument of this kind is probably that known as the Pierre Couverte, near Saumur, in France. It is 64 feet long, 14 feet wide, and about 6 feet high, and consists of four upright stones on each side, one at each end, and four on the top. The great stone of the dolmen represented in the accompanying cut is 33 feet long, 14½ feet deep, and 18½ feet across; it is calculated to weigh 750 tons, and is poised on the points of two natural rocks. It is now generally believed that dolmens were sepulchers, although afterward they may have been used as altars. They are often present within stone circles. The dolmen was probably a copy of a primitive rude dwelling, and may sometimes have been the actual structure in which the savage sheltered himself, converted afterward into his tomb. In several cases one of the stones is pierced with a hole. This is supposed to have been for the purpose of introducing food to the dead. Conclusions in regard to the original identity of various races have been based on the similarity of such structures in various parts of the world, as in Hindustan, Circassia, Algeria, and Europe; but too much importance may be attached to this, as the inclosed dolmen is simply the structure which savages of a very low type, of whatever race, would naturally erect for shelter. See *cromlech* and *menhir*.

2. In *law*, the place where a person has his home, or his principal home, or where he has his family residence and personal place of business; that residence from which there is no present intention to remove, or to which there is a general intention to return. The domicile depends not on citizenship, nor on presence, but on the concurrence of two elements: 1st, residence in a place; and 2d, the intention of the person to make that place his home. Thus, a man may be a citizen of one country, have his domicile in another, and temporarily reside in a third. Domicile is of three kinds: 1st, *domicile of origin* or *nativity*, depending on that of the parents at the time of birth; 2d, *domicile of choice*, which is voluntarily acquired by the party; and 3d, *domicile by operation of law*, as that of a wife arising from marriage. The term *domicile* is sometimes used to signify the length of residence required by the law of some countries for the purpose of establishing jurisdiction in civil actions; in Scotland, residence for at least forty days within the country constitutes a domicile as to jurisdiction. All questions relating to personal property, in matters of debt, intestacy, or testamentary disposition, are determined by the law of the place of domicile, while those relating to real property are subject to the law of the place where it is situated. The property of a foreigner domiciled in a country with which his own is at war is held to be subject to seizure as that of an alien enemy.

It would be more correct to say that that place is properly the *domicil* of a person in which his habitation is fixed without any present intention of removing therefrom.
Story, Conflict of Laws, iii. § 43.

"Two things must concur," says the same eminent jurist [Story], "to constitute *domicile*—first, residence, and secondly, intention of making it the home of the party," and when once *domicile* is acquired it is not shaken off by occasional absences for the sake of business or of pleasure, or even by visits to a former *domicile* or to one's native country. *Woolsey*, Introd. to Inter. Dominical or Sunday letter, one of the seven letters A, B, C, D, E, F, G, used in calendars to mark the Sundays throughout the year. The first seven days of the year being marked by the above letters in their order, the following seven and all consecutive sets of seven days to the end of the year are similarly marked, except that in leap-years the 24th and 25th of February receive the same letter; so that on whatever day the first Sunday of the year falls, the letter which marks it will mark all the other Sundays of the year, except in leap-year, when after February 24th the dominical letter for the remainder of the year changes to the one preceding. (Many modern writers make the change of letter to occur after the end of February, the 29th taking no letter.) After twenty-eight years the same letters return in their order. The use of the dominical letter is primarily to aid in determining the date of Easter; but it may be used, by calculation, for finding the day of the week on which a given date falls in any year, past or future. To find the dominical letter of any year, let *p*, *q*, *r*, *s*, respectively, be the digits in the thousands', hundreds', tens', and units' places of the number of the year. Then, if the year is new style, find the sum $6p + 2q + 5r + 4s + 1$, and diminish it by the quotient of the year divided by 400 (neglecting the remainder). If it is old style, form the sum $3(p + 1) + q + 5r + 4s$. In either case increase the result by double the remainder after dividing the year by 4 (this remainder being taken as 4 for January and February of a leap-year). Divide the result by 7, and the remainder is the ordinal number of the dominical letter in the alphabet (the ordinal number of G being called 0).

II.† *n.* **1.** The Lord's day; Sunday.—**2.** The Lord's house; a building used for religious service.

II. *n.* One of an order of mendicant friars instituted by the Spaniard Domingo de Guzman in Languedoc in France, and confirmed by the pope in 1216. The official name of the order is Fratres Prædicatores (rendered in English Friars Preachers, Preaching Brethren or Friars, Predicants, or Order of Preachers), preaching and instruction being the chief objects of its foundation. It was established by Dominic himself also in Italy and Spain, and spread rapidly in other countries. In England its members were called Black Friars, from their black cloaks, and in France Jacobins, from the church and hospital of St. Jacques (Jacobus), in which they were first established in Paris. Their rules, based upon those of St. Augustine, enjoin poverty, chastity, fasting, and silence; but the last two may be dispensed with when they would interfere with active duties. The officers of the order are all elective. The highest, holding his place six years, is termed general; provincial and conventual priors have charge respectively of provinces and convents. The Dominicans and Franciscans, originating about the same time and long vehement rivals, were the leading orders of the Roman Church until the rise of the Jesuits in the sixteenth century. They still exist in many countries, but with reduced influence. The dress of the order is a black mantle and a white habit and scapular. An order of Dominican nuns was also founded by Dominic.

Donatist (don'a-tist), *n.* [< LL. *Donatista*, Donatist, < *Donatus*, a man's name.] One of an early Christian sect in Africa which originated in a dispute over the election of Cæcilian to the see of Carthage, A. D. 311, occasioned by his opposition to the extreme reverence paid to relics of martyrs and to the sufferers for the Christian faith called confessors, and the rivalry of Secundus, primate of Numidia. Secundus and the Numidian bishops declared Cæcilian's consecration invalid because conferred by Felix of Aptunga, whom they charged with being a traditor. They excommunicated Cæcilian and his party, and made one Majorinus bishop in opposition. The name Donatist came either from Donatus of Casse Nigræ, who headed the party of Majorinus at the Lateran Council in 313, where it was condemned, or (more probably) from Donatus "the Great," who succeeded Majorinus in 315 and under whom the schism became fixed. Repressed under Constans, the Donatists revived under the favor of Julian the Apostate. Repressive measures, provoked by their frequent acts of fanatical violence, were resorted to from time to time. These measures, internal schisms, the conciliatory conduct of the orthodox clergy at a conference held at Carthage in 411, and the arguments of St. Augustine caused many to abandon Donatism, and the sect became insignificant, though not entirely extinct till the seventh century. The Donatist party held that it constituted the whole and only true church, and that the baptisms and ordinations of the orthodox clergy were invalid, because they were in communion with traditors. They therefore rebaptized and reordained converts from Catholicism. See *Circumcellion*, *Maximianist*, *Primianist*, *Rogatist*.

It consists of two volumes in vellum, a large folio containing 382 pages, and a quarto containing 450. They form a valuable record of the ownership, extent, and value of the lands of England (1) at the time of the survey, (2) at the date of bestowal when they had been granted by the king, and (3) at the time of Edward the Confessor, when a somewhat similar survey had been made; the numbers of tenants and dependents, amount of live stock, etc., were also returned. The book was long kept under three different locks in the Exchequer, along with the king's seal, but is now kept in the Public Record Office. In 1783 a facsimile edition printed from types made for the purpose was issued by the British government. The counties of Northumberland, Cumberland, Westmoreland, and Durham were not included in the survey. There existed also local doomsday books.

See *cyma*, 1.—**Doric dialect.** See II.—**Doric mode.** See *mode*.—**Doric order**, in *arch.*, the oldest and strongest of the three Greek orders, in its external forms the simplest of all, but in its most perfect examples, especially as exhibited in the monuments of the age of Pericles at Athens, combining with solidity and force the most subtle and delicate refinement of outlines and proportions that architecture has known. In a de-

based and distorted form, the Doric constituted the second order of the Romans, coming between their Tuscan and Ionic. A characteristic of the Grecian Doric column is the absence of a base; the channelings are usually 20 in number, and in section approximate to a semi-ellipse; the capital has generally no astragal, but only one or more fillets or annulets, which separate the channelings from the echinus. The profile of the capital in the best examples is a carefully studied eccentric curve, neither flat enough to be hard in effect, nor full enough to be weak. The echinus prior to the time of perfection spread out far beyond the shaft; the later Greeks made it a frustum of a cone, and the Romans cut it as an ordinary quarter-round. In good Greek examples, as a rule, no horizontal lines are found in a Doric building, floor- and cornice-lines, etc., being curved slightly upward; the profiles of the column-shafts are slightly convex, and all columns are slightly inclined toward the center of the building. All these particularities have relation to optical effects so subtle that their influence is felt rather than seen.

It is a contribution by the wife's family, or by the wife herself, intended to assist the husband in bearing the expenses of the conjugal household. Only the revenue belonged to the husband, and many minute rules . . . prevented him from spending it on objects foreign to the purpose of the settlement. Throughout the sixteenth century the doublet usually had sleeves; under the reign of Charles I. of England it became universally an undergarment, being made without sleeves, and was thus the prototype of the modern waistcoat. So long as doublets were a common garment for men, they were frequently imitated in the fashions of feminine dress: thus, a similar body-garment for women was worn about 1580, and again in the reign of Charles II. of England, corresponding nearly to the modern sack, having sleeves and short skirts.

2. In *law*, the portion which the law allows to a widow for her life out of the real property in which her deceased husband held an estate of inheritance. At common law it is one third of such real property held by the husband at any time during the marriage as the common issue of the husband and wife might have inherited, except such property as has been conveyed with the concurrence of the wife. The wife may also bar the right of dower by accepting a jointure. By modifying statutes, in some of the United States, the dower is sometimes a share in fee, and sometimes extends only to property which the husband held at the time of his death. In England, by the Dower Act of 1833, the common-law rights of the wife have been greatly modified, her dower being entirely under the control of the husband. In the earlier periods of the common law several kinds of dower were usual, as *dower ad ostium ecclesiæ*, which was dower voluntarily pledged by the husband at the porch of the church where the marriage was solemnized; and in this case the share might be less than a third, or (except for a restriction at one time imposed for the protection of the interests of feudal lords) it might be more than a third. This was, sometimes at least, done by the declaration in the marriage service "with all my lands I thee endow," or the husband might specify a particular manor or other lands. If he had no lands, or chose to mention goods only, the declaration was, as now, "with all my worldly goods I thee endow," in which case the wife, if she survived him, was entitled to a third of the personal property left by him; and if he left lands, the law, notwithstanding his omission to promise dower in them, gave her what was called *reasonable dower*, or *dower according to custom*, viz., the life estate in one third as above described, unless she had accepted a jointure or other provision in lieu of dower.

The *dower* of lands in English law . . . belonged to a class of institutions widely spread over western Europe, very similar in general character, often designated as doarium, but differing considerably in detail.
Maine, Early Hist. of Institutions, p. 338.

At common law this is effected only by joining in the husband's deed of conveyance.—**To assign dower.** See *assign*.—**To bar dower**, to preclude the claiming of dower by a widow, as by her joining her husband in conveying during his life.—**Writ of dower**, a process for the establishing of the right of dower, or the recovery of the land by the widow.

draft[1], **draught**[1] (dra̧ft), *n.* and *a.* [This word has changed in pron. from *draught* (ME. and mod. Sc. pron. dräċht) to *draft* (pron. dräft, dra̧ft), and the fact has been recognized by the spelling *draft*, which, dating from late ME., is now the established form in the military, commercial, and many technical uses, in which the literary traditions in favor of *draught* are less felt; in other uses the spelling *draught* still prevails, though *draft* is not uncommon in many of them. There is no rational distinction between the two forms; *draft* is on all accounts preferable. (The *f* represents the changed sound of the orig. guttural; a similar change is recognized in the spelling *dwarf*.) Early mod. E. usually *draught*, rarely *draft* (dial. also *drought*, *drait*: see *drought*[2], *drait*), < ME. *draught*, *draugt*, *drauht*, *draht*, also rarely *drafte*, also, with loss of the guttural, *drawte*, a drawing, pulling, pull, stroke, etc., not found in AS. (= MD. *draght*, *dracht*, D. *dragt* = MLG. LG. *dracht*, a load, burden, = MHG. *traht*, G. *tracht*, a load, = Icel. *drāttr*, a pulling, draft of fishes), = OSw. *drækt*, Sw. *drägt* = Dan. *dragt*, a burden, litter, draft; with formative *-t*, < AS. *dragan*, draw, drag: see *draw*. The uses of *draft* are so numerous and involved that their exhibition in linear sequence is difficult. All the senses attached to the word in either spelling with their quotations are here necessarily exhibited together under *draft*[1], *draught*[1], although, of course, most of the obsolete senses are found only in the older spelling *draught* (in its various ME. forms). Modern senses in which the spelling *draught* is still prevalent over *draft* are indicated. In cases not so indicated, *draft* is the prevalent spelling. The compounds in which *draught* is the only recorded spelling are given under that spelling.] **I.** *n.* **1.** The act of drawing or dragging (in any sense); a drawing; a draw; a haul; a pull. 15. The drawing or moving of air; the air so drawn or moved; a confined current of air, as in a room or in the flue of a chimney. The draft of a chimney depends, apart from the mode of construction, on the difference of the density of the rarefied column inside the chimney, as compared with an equal column of the external atmosphere, or on the difference in height of the two columns of elastic fluid, supposing them reduced to the same standard of density. The velocity of the current is the same as that of a heavy body let fall from a height equal to the difference in height of two such aërial columns. Drafts may be produced or increased (*a*) by a blast which rarefies the air above the fire (a *blast-draft*), or (*b*) by blowers which compress the air beneath the fire (a *forced draft*). When a forced draft is used on a vessel, air is forced into the fire-room, which is closed in such a way that the air can find egress only through the furnaces and funnels. In some recent vessels increased draft has been secured by the partial exhaustion of the air in the uptakes and lower parts of the funnels, which causes an increased flow of air from the fire-room through the furnaces. This is called an *induced draft*.

A fabulous animal common to the conceptions of many primitive races and times, or, as in the Bible, an indefinite creature of great size or fierceness. When described or depicted, it is represented as either a monstrous serpent or a lizard (like an exaggerated crocodile), or a compound of both, or (as in heraldry) as a combination of mammalian and reptilian characters; but always as winged, with fiery eyes, crested head, and terrible claws. It is often represented as blood-red and spouting fire, and sometimes with several heads, like the Hydra; and in the myths of the Scandinavians and other races, dragons are often the guardians of treasures, etc. The killing of a dragon was reckoned among the greatest feats of heroes in both ancient and medieval times; thus, the legend of St. George and the dragon is one of the most celebrated in Christian literature. The dragon is the imperial emblem of China, and is regarded by the Chinese as a sort of divinity, but by other peoples generally as the type and embodiment of fierceness and cruelty or watchful malice. In the Apocalypse "the dragon, that old serpent" is a synonym of Satan (Rev. xx. 2). In the Old Testament it is either a large land-animal or a great marine fish (Isa. xxxiv. 13—revised version, jackal; Ps. lxxiv. 13—revised version, dragon), a venomous land-serpent (Ps. xci. 13—revised version, serpent), or the crocodile (Ezek. xxix. 3—revised version, dragon). The same Hebrew word, *thannim*, is also sometimes translated *whale* (Gen. i. 21—revised version, sea-monster; Job vii. 12—revised version, sea-monster). The extinct pterodactyl comes nearest of all known creatures to the most prevalent conception of a dragon.

It has a large frill on each side of the body, formed of skin stretched over six elongated hinder ribs, which like a parachute sustain the creature in the air for a few moments. The structure is not a wing, and the animal does not properly fly, the arrangement somewhat resembling that in the flying-squirrel, flying-lemur, etc. The species are confined to the old world. A similar standard was in use as late as the reign of Richard I. in England, and is especially mentioned as being in his crusading army. Also called *dragon-standard*. See *drake*[2], 2.

F. *drachme* = Sp. *dracma* = Pg. *drachma* = It. *dramma* = D. *drachma* = G. *drachme* = Dan. *drakme* (cf. Dan. *dram* in sense 4, < E.) = Sw. *drachma*, < L. *drachma*, ML. also *dragma*, < Gr. *δραχμή*, later also *δραγμή*, an Attic weight, a Grecian silver coin.] 1. A unit of weight less than an ounce. The dram is generally supposed to be of Greek origin. Many weights of this denomination and its multiples have been exhumed at Athens, belonging to different systems, of 57, 67, 75, and 78 grains troy, and there were doubtless others. The Solonic dram, the Athenian monetary weight, had at first 67.4, later 66.6 grains troy. The Æginetan weight was greater, and is fixed by the latest authorities as normally 97 grains. A dram afterward appears in Phenician systems as a half or quarter of a shekel; and under the Ptolemies there was in Egypt a dram of 54.6 grains troy. Under the early Roman emperors a dram was introduced into the Roman system as $\frac{1}{8}$ of an ounce, equal to 63.2 grains troy. This relation to the ounce has been preserved in several modern systems. Thus, in apothecaries' weight, a dram is $\frac{1}{8}$ of an ounce, or 60 grains, divided into 3 scruples of 20 grains each. The avoirdupois dram, however (derived from the Spanish *adarme*), is only $\frac{1}{16}$ of an ounce, or 27$\frac{11}{32}$ grains. In the old Spanish apothecaries' weight a dram was $\frac{1}{9}$ of an ounce. In the Neapolitan system 10 drams made an ounce of 412$\frac{1}{2}$ grains troy. The Nuremberg drachm was 57.5 grains troy. The Tuscan dramma was 54.6 grains troy. In the Arabian systems the dram is properly represented by the mitcal, but the derham is often called a dram, and was in fact derived from the Attic *drachma*. Abbreviated *dr*.

In medical use commonly written *fluidrachm*.

drama (drä′mä), *n.* [= F. *drame* = Sp. Pg. *drama* = It. *dramma* = D. G. Dan. *drama* = Sw. *dram*, drama (first in E., in the common heading of plays, *dramatis personæ*), < LL. *drama*, < Gr. *δρᾶμα*(*τ-*), a deed, act, an action represented on the stage, a drama, esp. a tragedy, < *δρᾶν* = Lith. *darau*, do.] 1. A story put into action, or a story of human life told by actual representation of persons by persons, with imitation of language, voice, gesture, dress,

and accessories or surrounding conditions, the whole produced with reference to truth or probability, and with or without the aid of music, dancing, painting, and decoration; a play.

Westward the course of empire takes its way;
The four first acts already past,
A fifth shall close the *drama* with the day;
Time's noblest offspring is the last.
Bp. Berkeley, Arts and Learning in America.

A *drama* is the imitation (in a particular way) of an action regarded as one, and treated as complete. In the observation of the process of a complete action, and in the attempt to imitate it in accordance with such observation, must therefore be sought the beginnings of the *drama*. *A. W. Ward*, Eng. Dram. Lit., Int., p. xvii.

2. A composition in verse or prose, or in both, presenting in dialogue a course of human action, designed, or seemingly designed, to be spoken in character and represented on the stage; a form of imitated and represented action regulated by literary canons; the description of a story converted into the action of a play, and thereby constituting a department of literary art: as, the classic *drama;* the Hindu *drama;* the Elizabethan *drama*. The construction of such a composition is, as a general rule, marked by three stages: first, the opening of the movement; second, the growth or development of the action; third, the close or catastrophe, which must in all cases be the consequence of the action itself, as unfolded in acts, scenes, and situations. The drama, whether in actual life or mimic representation, assumes two principal forms, namely, tragedy and comedy; and from modifications or combinations of these result the mixed or minor forms, known as tragi-comedy, melodrama, lyric drama or grand opera, opera bouffe, farce, and burletta. Other forms, suggested by the subject and the manner of presenting it, are the nautical drama, the pastoral drama, the society drama, etc. Both tragedy and comedy attained a high degree of development in the ancient Greek drama, which originated in the worship of Bacchus.

Sophocles made the Greek *drama* as dramatic as was consistent with its original form. *Macaulay*, Milton.

It is sometimes supposed that the *drama* consists of incident. It consists of passion, which gives the actor his opportunity; and that passion must progressively increase, or the actor, as the piece proceeded, would be unable to carry the audience from a lower to a higher pitch of interest and emotion.
R. L. Stevenson, A Humble Remonstrance.

In the epic poem there is only one speaker—the poet himself. The action is bygone. The scene is described. The persons are spoken of as third persons. There are only two concerned in it, the poet and the reader. In the *drama* the action is present, the scene is visible, the persons are speakers, the sentiments and passions are theirs.
Dion Boucicault, in New York Herald, July 6, 1888.

3. Dramatic representation with its adjuncts; theatrical entertainment: as, he has a strong taste for the *drama*.

dredging-machine (drej'ing-ma-shēn'), *n.* An apparatus for lifting mud and silt from the bottoms of rivers, harbors, canals, etc. Some dredging-machines employ a single bivalve or clam-shell scoop; others a series of scoops on an endless chain; others some form of suction apparatus. The earliest form appears to have been a single box-like shovel or spoon, suspended from a crane rigged up on a large flat-boat. It was lowered into the mud, dragged along by means of ropes till filled, and then raised and emptied into the boat. Another early form is the chapelet or chain-pump, which, by means of an endless chain carrying buckets traveling in a trough, lifts mud and water, discharging them at the top into a flat alongside the machine. On this plan are now built some of the largest and most powerful dredging-machines in use. They consist of large, flat-bottomed

Steam Dredging-machine.

boats, usually of iron, with a bucket-chain carrying nearly 40 buckets, each with a capacity of about 13 cubic feet. In excavating the Suez canal, the lifting buckets of some of the larger machines had a capacity of 5 cubic feet each, and the delivery was 20 buckets a minute. For the delivery of the sand or spoil both chutes and traveling buckets were used, the spoil being, in some instances, delivered 230 feet from the dredger. The clam-shell dredger is largely used in the United States, and has the merit of ease of management, the scoop operating in a half-circle about the boat, so that a wide channel can be excavated without moving the boat. The scoop is suspended from a crane at the bow of the boat, and is operated by means of chains controlled by steam-power, two long flexible poles serving as guides for the clam-shell. In the machines employing a suction or exhaust, a tube is lowered into the mud, and the mud and water are raised by means of a revolving disk in the tube, or by the aid of a vacuum or an ejector. A large vessel on the boat, being exhausted of air, is connected with the submerged pipe, when the mud and water readily rise into the receiver. In another form of pneumatic dredger a pipe is lowered into the silt and closed air-tight, and steam is then turned into the upper part of the pipe, driving out the air. Many other forms are used.

The dressing of an ore, or the mechanical treatment, necessarily precedes the smelting, or chemical treatment. In the former it is chiefly the difference in specific gravity between the metalliferous portion of the vein and the veinstone itself of which advantage is taken for effecting a separation. 5. In *geol.*, loose detrital material, fragments of rock, boulders, sand, gravel, or clay, or a mixture of two or more of these deposits, resting on the surface of the bed-rock. The term *drift* was introduced by Lyell in 1840, to take the place of *diluvium*, with which latter word the idea of a universal deluge, and especially the Noachian deluge, had been generally associated. (See *diluvium*.) The word *drift* is now usually applied to detrital deposits when it is intended to include at the same time the transportation from a distance. Almost all detrital material has, however, been formed with more or less help from running water, and therefore must in that process have been moved to a greater or less distance from the place of its origin. It is especially with reference to material lying on the surface in northern Europe and northeastern North America that the term *drift* is used at present by geologists, and it is frequently called *northern drift*, since much of it has been moved in a southerly direction. And since ice is believed by most geologists to have been the principal agent by which this drift was moved, it is also denominated *glacial drift*, while the detrital material transported by the agency of ice at the present time is not so called. See *glacier* and *moraine*.

Such machines vary in form and size from a small hand-implement sowing one row to the gang-drill drawn by one or two horses, and heavy steam-power machines drawn by a rope from a traction-engine, as in steam-plowing. Horse-power drills are sometimes fitted with self-feeding devices for regulating the speed and the amount of feed from the hopper to the tubes that convey the seed to the ground. They all have some form of share or tool for opening or preparing the ground for the seed, immediately in front of the tube that distributes the seed. It is either forged and ground from solid steel or formed by fixing two movable cutters in a stock. Its action is rapid, but it leaves a rough surface, and must be followed by a finishing-tool.—**Lip drill**, any flat drill upon the cutting edge of which a lip is formed, either by grinding or during the process of forging. The lip adds to the speed and cleanness of working.—**Persian drill.** (*a*) A hand-drill operated by a nut moved backward and forward over a quick screw on the stock of the drill. It is a form of single-acting metal-drill.—**Teat drill**, a square-faced cylindrical drill with a sharp, pyramidal projection or teat issuing from the center of the cutting face. It is used to flatten or finish the bottoms of holes.—**Twist drill**, a cylindrical drill around the body of which is carried a deep spiral groove, so that the tool appears as if twisted from a flat bar. The point is sharpened to an obtuse angle. Such drills are used in all sizes, from a diameter of three inches down.—**Vertical drill**, a drill with a vertical spindle. *E. H. Knight.*—**Wall-drill**, a drilling-machine set up against a wall, and not fitted with a table to receive the work.
